I am trying to interface a modem to a handheld radio through the speaker/mic plugs on the radio.   I can get the radio and modem to receive data, but I cannot get the tx, because I don't know how to create the simulation of the PTT.   If I manually press the PTT, it works fine, but what I really need is for the modem to switch a line which will then simulate the PTT (say from a mic).

Is there a circuit I can use?   I would imagine the spkr/mic combinations one can get, have some circuitry in them to do this.

By the way, the mic jack on the radio only has two posible connections to the socket, and not a seperate one for the PTT.

Any help would appreciated,
Bruce

Greetings all

I've updated the club web site with details of some hardware I've acquired from a client who is scrapping a network. This comms equipment has been used here for over 5 years as a substitute for a TNC with 4 modem ports per board (I actually use 8 radio ports).

I've put all the details about the 4 port TNCs onto the club web site along with pictures of the kit, modifications, interface wiring, software capabilities.

Since there are about 100 of these boards available I've made the info as comprehensive as possible so as to make the use of this hardware as simple as possible - I'd really like it to be used after all the effort I've put in to get it and write the software for it!!

Any outstanding queries I'll try and answer by putting an FAQ on the web site.

Thames Valley IP User Group - http://www.tvipug.org -- using the Internet as a resource, not as a substitute for radio...

My latest project is a foray into packet spotting clusters, using AGWPE. It is taking a fair bit of time to get everything working, and it seems that after each problem is solved, another takes its place. I would certainly appreciate any suggestions or observations.

First, the environment. The computer is a 233 MHz Pentium. I am using a generic sound card for the TNC, single channel, 1200 bps. The OS is Windows NT Workstation 4.0 with SP6 installed. The sound card and interface setup works wonderfully for PSK31. The radio is a Kenwood TS-790A, and the cable plugs into ACC2 on the back panel.

The cable is the Kenwood 13 pin mini DIN plug, with pins 3,4 (audio in), 8,9 (audio out), and 11,12 (PTT) connected. The PTT switching is done via RTS.

The specific problem is that the AGWPE application seems to be deaf. It does not recognize incoming packets, i.e., the red and green lights on the little menu bar TNC icon do not flash. I have verified that signal is reaching the sound card, and that the serial port configuration is correct. IP support is not enabled on the AGWPE installation. The app will load properly, and to all appearances seems to be fine, but just can't hear.

I have verified the sound card, serial port, and interface configuration on AGWPE. I have also verified that the radio is tuned to a packet frequency and shows a good signal level. At this point I am rather lost about what to try next.

Suggestions or ideas are welcome. Apologies in advance for the spam blocked return address. I know it's a pain, but it sure keeps the spam out of my mailbox.

Thanks!

73,

Adam Adkins, KM5N

A few thoughts:-

Have you enabled line-in on the Windows volume control *record*
properties?

Are you sure you're using the correct channel?

You say you have verified the configuration, but against what? Another
working system or what you think it should be?

What version of AGWPE are you using?

When you look at the port in the AGWPE "RadioPort Selection" list, does
it have the word "idle" against it? If it does, then there's something
wrong with the configuration.

[This followup was posted to rec.radio.amateur.digital.misc and a copy was sent to the cited author.]

In article <pGlZPhAEcLw6EwkB@peaksys.co.uk>, roger@peaksys.co.uk says...

> Have you enabled line-in on the Windows volume control *record*
> properties?

Yes, that is enabled and working.

> Are you sure you're using the correct channel?

Hmm. I certainly think so. I have it configured for a single channel, and that is the only one in use.

> You say you have verified the configuration, but against what? Another
> working system or what you think it should be?

Not having a working system to compare it to, I have been using a guide another friendly ham made up. "Sound Card Packet," written by Ralph Milnes, KC2RLM, goes into considerable detail about installation, configuration and use. Whether it is entirely correct is another story, but it is logical and consistent, and based on techniques that actually worked. Nothing stands out as a glaring error, anyway.

> What version of AGWPE are you using?

Version is 2000.78

> When you look at the port in the AGWPE "RadioPort Selection" list, does
> it have the word "idle" against it? If it does, then there's something
> wrong with the configuration.

No, it does not indicate "idle" (at least that I recall). I'll have to check that.

Thanks for the response.

Hi,
I have a problem using ChromaPIX with my TS-2000. I have no problem
receiving.When I try to transmit, PTT, no data (audio->acc2.pin11) is being
transmitted.
I know the audio is coming out of the sound card, and have pinned out my
cable.I generate many times the Test Tone and the TS2000 keys up, but no
audio is present.
I've tried adjusting audio levels without success.
Is there something else I may have overlooked?
Thanks in advance
Manos

I found a good website that helped me get AGWPE configured and working correctly.

http://www.qsl.net/soundcardpacket/index.html

Hope this helps!

Could there be an impedence mismatch between your sound card's audio output and the radio's TX audio input (or mic input)? Are you using the speaker output or the "line out" output from the sound card? The speaker output has much different characteristics....

Which PTT are you using?  You should use PKS - pin 9.
This is different from SS - pin 13.  See page 95 of the
manual for details.

Also, which ground are you using?  Not just the shield
(braid) right?  Are you using pin 12?

In article <985782643.936709@athnrd02.forthnet.gr>,
pelamare@her.forthnet.gr says...

Does anyone have information (website, Company name, etc.) on manufacturers of VHF Low band radios.   They need to be CE certified, and would prefer a radio/modem combination, but also would look at the radios only.

It is hard enough to find manufacturers of Low Band equipment, yet add in another parameter of being CE certified.

Help would be greatly appreciated,

Bruce

The latest flash-rom update for the PTC-II, version 3.0, is now available on the SCS website for the PTC-II.

To make the update super easy, try using Winupdate by PA0NC ... it makes the entire update process smooth as silk.

The TAPR TNC-2 documentation is pretty close:

ftp://tapr.org/software_lib/tnc/tncdocs.zip
ftp://tapr.org/software_lib/tnc/tnc2sch.pdf

The major differences between this and the MFJ 1270B are removal of the
MF-10 filter and the addition of a switch to go between 1200 and 300
baud.

It must be awfully embarassing to try to pick on someone, only to discover that you've made yourself look like an idiot.

If you try reading again, you'll discover that Mr. Teaze asked what frequencies the DEM equipment transverted *to*, not what they transverted *from*. Which, of course, is a perfectly logical and reasonable question to ask.

Well, since I'm interested in 56k, I'll ask a similar question.
On what frequency in the 220 band do these transmit?

You will need to install DOS on the computer, after you have done that
you will need a DOS based terminal program. I use Qmodem, its
shareware so I can email you a copy if you can't find it. I have it
running on two laptops. One here at the home QTH and one at my cabin.
Its great, I picked up my last lapop for only 80$ it is a Compaq 386
at 33 Mhz and get this, it has 36 megs of memory!

If you need detailed instructions on the DOS side email me at
dmccord@usol.com
and I will talk you through it. All re really need is a copy of DOS,

you should be able to buy one on ebay for next to nothing!

73's KA8OCN

Since "transverting" is a TWO-WAY process, terms as "from" and "to" don't make sense without knowing which end one is starting from, which was NOT specified. Since "220" was the only thing specified, I understood this as if he wanted to know where the other end was, and that's 10m.

DEMI's web site clearly shows that 28MHz <=> 222MHz. Of course, frequencies around that will be linearly distant from both ends (the transverter is linear).

However, to complete an answer to his question, he needs to find out the exact range of the RF modem. I shall let him go to the manufacturer's web site to find that out for himself (i.e. where in 10m it uses).

Use Pins 1 through 8 and 20 for programs that use host mode or
hardware control. For terminal programs like hyperterminal, procomm,
Qmodem etc the PK-232 only requires the 3 pin connections.

Hi, here is the info from DEM on the trnasverters
The rf modems will allow selection of the output frequencies.

Jim WU3V

The DEM 219-29 is a 219 MHz to 29 MHz transverter designed specifically to operate with the PacComm 56kb RF modem (GRAPES Modem). Separate mixers and filters are used in the receive and transmit sections of the transverter to provide additional isolation enabling the transverter to perform the fast switching functions required by the 56kb modem. The 219-29 output power is approximately 35 watts. On receive, a GaAsFET preamplifier, a Doubly balanced mixer, and two helical filters provide a sensitive, yet over-load proof front end with superior out of band rejection. The DEM 219-29 uses solid state switching for the DC and RF controls. IF connections are via matching BNC connectors and the RF connector may be either UHF or type "N". The control and power connections are RCA connectors. The 219-29 is housed in a 7.4" x 4.7" x 2.2" aluminum die cast box with an external 7" x 4.5" x 3/4" heat sink to provide cool operation under any condition. A complete kit version is supplied with all hardware, connectors, machined enclosure and heat sink.

Guess I've been asking the wrong question.
What frequency or frequencies do the GRAPES modems handle?
Are they freq agile such that the output freq could be adjusted
to any frequency within 219 - 225? What granularity?

To phrase it another way, would this system run on 223.100
as it stands without any changes?

Note:
     1)  The PacComm 56kb modem and the WA4DSY modem aren't necessarily the
same thing.  There could be differences in the version implementation.  The
response below did not say that they were.
     2)  DEMI also makes a 28-222 transverter.  My answer was based on that.
You need to find out which one the guy has.

I think I know the reason for the misunderstanding. My newsreader does not
display all the characters from the Subject line; so the "220 transverters"
part was dropped off, and there was no mention of the output band of the
transverter - hence my question.

Stussy - as far as me trying to make money off of radios - all I can say is
"what the hell is YOUR problem"? You did come off looking like a jerk in
your response. AFAIK, I've never had any beef with you, why all of a sudden
are you getting anal? I'm just gonna assume you were having a bad day.

BTW, I'm not really interested in 1.25m transverters... 70cm, maybe.

Hello all,

I have a problem with trying to control the transceiver frequencies from the radiomodem. The modem puts out RS232 in the 8-N-1 format, but the transceiver needs O-8-1, that is odd parity, an extra bit.

Does anyone know of a magic black box you can put i series with the RS232 line and add this extra bit?

Or any other solution on the problem?

Thanks in advance
please reply directly to my e-mail adress as well.

 I have WINPACK 6.51 when I run the beacon the beacon sends out
N0CALL instead of MYCALL. I am using it with the AGW Packet engine
and does anyone know how to solve this problem?

Close WinPack, edit PACKET.INI, and remove the line in the [WINPAGW] section that says "BCALL=NOCALL".

Go to the control panel and select "System"
and then select "Device Manager".
In the "ports" line click the "+" and select the COM port
you are using to access the modem. Select "Properties" and set the
"Port settings" to what you need.

HTH,

Hi,

I would be interested in hearing from anyone who has managed to get more than one (1) port running on TSTHWin, and how you went about it.

I have been using TSTHWin v2.21a (Registered) under Windows 95 for some 18 months and have found it a great Packet Radio program, I had used TSTHost v1.43b for quite a number of years before changing to TSTHWin.

I had no trouble running multiple ports using TSTHost with TFPCX and any combination of Kiss TNC's and Baycom modems using the TSTHost.cfg file line (PARAM 0 @PO 0011230) for 4 ports, to indicate to TSTHost the port each of its channels was to use.

Unfortunately the line (PARAM 0 @PO xxxxxxx) cannot be used with TSTHWin as the PARAM command is used to set the TNC parameters and not the Port allocation.

I am using TSTHWin with a TNC in Kiss mode on Com:2 which requires Tfwin32.dll and Tfwin.ini to be in the the Windows Directory.

I have used the following settings in Tfwin.ini for Port 0 to sucessfully run one (1) TNC in Kiss mode on Com:2, ports 1 to 9 are disabled.

```
[Port 0]
Type=KISS
Options=0
Baud=9600
Com=2
Enable=1
Address=0
Init=0

[Port 1]
Type=KISS
Options=0
Baud=9600
Com=4
```

```
Enable=0
Address=0
Init=0
```

I can run TSTHWin with Port 0 or Port 1 enabled, but it will not run when both are enabled.

In the the "DRSI Interface, TFWIN32" section of the Help File it mentions that using C ZL2THM, TSTHWin will try and connect to ZL2THM using Port 0, and if you use C1:ZL2THM, TSTHWin will try and connect to ZL2THM using Port 1. Whenever I try C1:Zl2THM, or C0:ZL2THM (ZL2THM only used as an example callsign) TSTHWin responds with "unknown command".

I use a .bat file to start TSTHWin that calls Setkiss.exe to put the TNC into Kiss mode and then starts TSTHWin, and as mentioned above I can use the TNC on either Com:2 or Com:4 but not both together. Although when I alter the .bat file to put both TNC's into Kiss mode and then load TSTHWin, the TNC's are put into Kiss mode but TSTWin does not complete loading.

It would be greatly appreciated if anyone who has TSTHWin v2.21a working with two (2) or more ports would let me know how you achieved it, and if possible, send me copies of your Tfwin.ini and TSTHWin.cfg files, and any other pertinant information.

Thanking you in anticipation.

Regards

Malcolm ZL2THM

I'm working on a setup for our local emergency center that will involve setting up a JNOS type Packet BBS to link us to different counties around the state. We would like to take this a step further and network the JNOS computer with other computers in the office so that message can be directly addressed to the voice operating positions.

I've been going through the book titled, "NOSIntro - TCP/IP over Packet Radio" and it alludes to the fact that this sort of setup can be done. However, I'm having a hard time trying to figure out how. Does anyone have any experience with this that could help?

Yes. Abandon all hope and switch to Linux. JNOS is 10+ years old.

My Kantronics KPC3+ starts every display line of received packet with a vertical bar (like the old "pipe") and a capital letter A. Is there some setting that I have messed up that causes this weird behavior?

TIA Rick N6CY

Some folks just aren't ready for Linux. It is more of a bear to setup than JNOS is on any platform. However, for better help, you may want to consult the ftp site ftp://pc.usl.edu/pub/packet_drivers/ and download drivers_v9.zip. In that archive you'll find a number of drivers supporting various makes of ethernet cards and documentation on those drivers. The fun part is learning how to integrate them with JNOS. You will have to load the driver of you choice prior to loading JNOS. It can best be done from a .bat file. In your AUTOEXEC.NOS you need to ATTACH that interface and add the appropriate commands in the IFCONFIG command group. Here's a sample attach statement:

```
attach packet 0x60 ethr1 4096 1024 ipaddress
```

0x60 being the interrupt you defined in the command to load the packet driver for your NIC. ethr1 is just a name for the interface (use what you want). 4096 is the buffersize, 1024 max trans unit. ipaddress can be specified if you do not want to use the address defined by the IPADDRESS command, eg 44.192.192.1, you may want to use something like 192.168.0.x if your network uses that domain.

On a TNC2 this is related to "stream switching", a failed attempt to multiplex the data of more than one connection onto a single terminal.
|A would mean that it is data from the first connection.

Look at the commands starting with "STREAM".

Rob

Hi all,

Just happened to drop in here and read some of the posts. Are folks still out there using WA4DSY modems at 56KB? I have 2 from the early part of the 90s still in use. But I had thought that packet radio except for cluster, had faded away.

Nice to know some are still out there.

73s

Hello all.
I am trying to find out how I can run Packet radio with my Yaesu VX5R under
Windows 2000 with a Baypac modem.
Has anyone any experience running packet while using win2k and a laptop?
Thanks in advance.

Hello all,
just a little question about digital transmission,
could you give me the official abbreviations ( SSB:J3E) for the following
digital  transmissions: SSTV, PSK31, RTTY, packet etc.
tnx for your help

Hello group. I just got one of these Hal spectra-tune SPT-1 rtty indicators from ebay. The connectors are cut and i have only wires coming out for the power supply. What i need to know is how many volts the power supply should be 9? 12? and do the input connectors need mark and space inputs, line out inputs? Any help is appreciated and would gladly pay copying costs for a manual. Thanks very much. N3UVT...bob.

If the software uses direct access to the hardware (DOS required) then you can't. With WIN2000 it is IMPOSSIBLE for your own protection. Your solution is different software if available or a REAL TNC. The other choice is to set up a dual boot system. OR switch to something good like PSK31 and get sound card programs that are free and do work on WIN2000. If you must use packet then you may be out of luck without the changes I mentioned.
As for the guy that suggested LINUX, then ask him to supply the applications!

The modem is synthesized, with 10 front panel switch selectable
frequencies in 100 kHz steps. The base frequency is programable
in EPROM to anywhere in the 10m band. Programming information
is available from Dale if you want a different base frequency than
the stock one (28.0 MHz IIRC).

For frequency agility over a greater than 1 MHz span, the easiest
solution is to switch crystals in the transverter used. For example,
our 70 cm 56 kb repeater has a 5 MHz split as is typical of repeaters
in this band. So the TR wiring in my setup switches the crystal in the

Microwave Modules transverter I use to access it. This is simple with
the MMT units because they come with two switch selectable crystal
positions. A simple diode OR connection to PTT does the trick.

I agree. It can be done with JNOS, but it is much easier if you abandon
that kludge and just install Linux. It then becomes a routine network
configuration task using the supplied configuration tools.

Thanks Gary, that was helpful.

Still didn't find out if the units being sold will, as they stand,
run on 223.100 ... or what frequencies they do have.

Sounds like "any even 100 KHz within some 1 MHz portion
of the 220 band". My question was "which one".

Your silly answer to my question is just what I would expect from many of

the "ignorant" users of linux today who fool themselves with the pro's and
con's of linux. For your information. I do have Linux redhat v7 running on
my 3 servers which are my mail servers file servers and web servers. All of
these machines have dual boot config with windows2000 advance server as the
alternate OS. The problem with Linus is it is not a mainstream OS. It has
many advance features for advance networking, but as a workstation that
needs to interact with many other OS's and workstations, it is worthless
(like your answer).
Another thing that makes your answer so silly is that I mentioned that I am
using a laptop. I can gather from your silly answer that you have never
tried to configure all of the hardware on a laptop from within linux. This
is something that is not easily accomplished. Some laptops from very few
makers are supported under linux and rarely are all the advanced features
kept when linux is installed because of a lack of support for true mobile
workstations.
One word for you. "Dont teach your father how to (you figure it out)."
Next time, if you want to give a silly answer have all the facts ready so
you dont seem as silly as your answers do.

Pretty much all of the *NOS variants can do this.
Some will run in a DOS box in windows.
Most run best on a machine running DOS.
Some run on Linux.
You might check my web site and poke the w0rli link.
There is some online documentation that may be useful.

The type of setup you are looking at is pretty much the usual way of running NOS: as a link between the standard tcp/ip protocols, and the packet BBS network. The simplest setup involves a dedicated DOS machine (junker 486 will do) to run the *NOS routing / gateway / mail server code. Then you run any BBS you like (e.g. FBB) for the BBS users. The tcp/ip users are handled by the *NOS machine. This way you get the best of both worlds: users can choose which way they want to interface to the system, the sysop can choose the optimum way to transfer messages around the system (BBS forwarding or smtp/nntp).

As others have pointed out, W2K won't support programs that must directly access the hardware. Your best bet might be to boot to DOS or Win9*. For DOS you might be able to put everything you need on a floppy. For Windows you would need to make a second partition and set up a dual boot system. If your entire hard disk is now devoted to W2K there is a free program called FIPS which you can use to divide an exisiting partition -- I have used it with NT 4.0, and it should also work with W2K. Partition Magic could also be used.

I have set up dual-boot W2K + W98 and W2K + Linux systems where I work, it is not hard to do.

Nonesense. He is looking for something that can be easily used
by hams that are not much interested in the technical details of
how things work. They probably know a little bit about windows,
and perhaps a bit about DOS. They may even have MACs.

The only thing Linux adds to the mix is a need for someone to
install and maintain the Linux systems. Lot of ongoing work,
and total overkill for the task at hand.

We are in the process of evaluating a similar setup here, for the
Red Cross. Linux was mentioned once, and it never came up again
as a viable solution. Various *NOS + FBB appeared to be best.
Long haul HF forwarding was one requirement, since some big
open spaces need to be covered here in the Pacific NW.
WinLink or SNOS look like the only viable solutions for the
long haul links.

Apparently you have looked at Linux five years ago and are still using
your experience as a reference. Too bad.

Things have changed in the Linux world. Installation and maintenance
has become easier. Things have also changed in the real world. DOS
solutions are no longer considered viable by most people.

Nonesense. I look at it every few months in hopes something
useful to folks not "interested in the guts of OS" could use.
Not much there yet. Getting better though. Maybe 3 or 4 more years.

> Things have changed in the Linux world. Installation and maintenance
> has become easier. Things have also changed in the real world. DOS
> solutions are no longer considered viable by most people.

The issue at question though is a bit different. Machines running
Windows and DOS are already available, and the folks who
will use them already know how. The applications are available.
Those applications work, and have a history of proven stability.

Do the ham radio applications for Linux support PTC-II and HAL
controllers? I've never seen any Linux system using CLOVER yet,
and have not heard of any using PACTOR-II. If they do exist, give
me some calls and scan freqs and will check them out.

Guess what I meant was "do" in the same sense Linux "does" Ax.25.
```

Applications exist for dumb terminal mode use of the protocol, and also to hook it into the tcp/ip stack, but there may not be a driver available that just drops it into the socket library (or is there?)

Same comments for NET/ROM, ROSE, TEXNET and the other L3/4 protocols.

> There are, to my knowledge, no "soundcard" implementations of neither PACTOR-II nor Clover for Linux.

The problem is the protocols. Requires reverse engineering ... I know a bit about the internals of the CLOVER protocol, and suspect it would be "difficult" to reverse engineer, but not impossible. i.e. you would have to black box it.

> The hardware, delivered by Halcomm and others, do have an RS-232 serial interface, which of course can be interfaced to any kind of computer (with a serial port).
>
> There seems to be two serial protocols for talking to Clover devices (URL:http://www.halcomm.com/docs/e2005c.pdf). I have not seen any software for Linux that implements the proprietary protocol (It's not very complex, so it shouldn't be hard at all to implement given interest and some programming skill). The other serial protocol uses a subset of the Hayes AT command set. Most terminal programs supports this (even for Linux :)
>
> Any device supporting a text-based serial protocol (like TNC's, PK-232 etc. etc.) can of course be used from Linux, with programs like 'minicom', 'seyon' and several others.

Possibly could use the PTC-II and DXP38 controllers this way. They really need smarter applications though, and from what you say nobody has done this yet. The code to drive the DXP38, for both the FSK and CLOVER modes takes about 2000 lines of C, but a good deal of that is dealing with the various command and status information in a "nice" way, Could port it to Linux without too much trouble, as it already is split into driver part and API part. The API is sockets, so many applications would be able to use it without a lot of change. My previous version of the driver code source is available, have not made the current version source available.

> What using these "generic" programs won't give you is the menus and controls, for easy operation, as the specialized programs do. There is however possible to tailor these generic programs do to a lot of what you want.

Exactly. So hams will tend to use DOS or Windows where those applications are available.

> As for other modes -- there exists several soundcard solutions for PSK31. Thomas Sailer, HB9JNX, has experimented with

> RTTY, AMTOR/SITOR and PACTOR-I for soundcard.

I was aware of the AX.25 sound card work, but had not seen
the Linux PSK31 work before. Thanks for the pointers.

Maybe someday someone will create the appropriate driver.
Things like this can be done in windows, but not at the application layer.
Gotta be some windows driver hackers out there who are also hams?

That's why pretty much everyone does it in DOS (where you can have
complete control over all the hardware), or in Linux where you have
the OS sources available to modify as needed.

> Maybe someday someone will create the appropriate driver.

I don't think that even a Windows compliant driver would do it, Hank.
My understanding is that under Windows you have no control over when

your code will run - it runs when Windows tells it to run which gives
you no way to do critical timing. Even with DOS you can have problems
with things like disk access grabbing the processor and messing up
your timing algorithms. In DOS there were work arounds but they were
all messy and could get you into a lot of trouble. Windows seems to be
getting worse rather than better in that regard.

Anyone had any luck using Multimode for psk31? The documentation dont tell u
a whole lot abt using it. I have an Icom 751 and a PowerMac 7200.
Thanks
Bill

Even with DOS you can have problems with things like disk access grabbing the processor and messing up your timing algorithms. In DOS there were work arounds but they were all messy and could get you into a lot of trouble. Windows seems to be getting worse rather than better in that regard.

The trick in your windows driver is to run it with interrupts off for the timing critical sections, and to have your own timer interrupt hardware to cause the interrupts to happen. It *is* a real mess to do this stuff in windows. There are commercial data acquisition cards that use this technique ... have seen the code for one of them, and it was a real mess. You are basically sneaking something in under the radar of the windows scheduler. Ugh. Thus my (tongue in cheek) comment about someone creating the "appropriate" driver.

Similar issues in Unix.

Surprised nobody has mentioned QNX as a platform to do stuff like this.

My own preference is to have that timing critical stuff in its own box, or on its own card. For fast networks, we would want the routers there also, for the reasons you mention. For our typical slow networks, a DOS box makes a nice protocol machine and router though, and

you can get old 386/486 boxes for free. Stick it over in the corner
and forget about it ... and run the applications on whatever OS you
happen to like.

Yeah, some extremely masochistic/saintly person out there, wanting to experience
huge pain, so that a bunch of ham radio pirates can rip him off. On top of that,
he'd probably get sued by the Pactor people for violating their patents. Ooh,
let's all line up for that. Heheh.

Don't the Winmodems do some comparable stuff in hardware?

I mean to mess with my HF packet setup some more. My work is finally
winding down, after a few months of serious heavy hours. Unfortunately, I decided
on remodeling my bathroom, rather than going for Pactor 2 modem. But, I
feel like getting back into it.

I think Hank is referring to kernel mode device drivers that are activated by an interrupt or by an application program call. Unless you disable all interrupts, the expected latency can be predicted quite reliably.

>My understanding is that under Windows you have no control over when
>your code will run - it runs when Windows tells it to run which gives

I don't know about Win9x, but at least a lightly loaded NT will wake up from a multimedia timer event within 1 .. 3 ms with over 99 % reliability in user mode.

At least previously, bad Ethernet, IDE and SVGA cards/drivers were responsible for most of the huge time variations. Some video drivers were trimmed for maximum AGP performance by not checking for other bus requests during a transfer. Fortunately, new cards/drivers are much better in this respect, since the need to implement various multimedia (audio/video) applications can not tolerate such "asocial" driver behaviour any more.

I don't think it is impossible to implement such low transfer rate modes with a sensible division of labour between the kernel mode driver, a user mode real time priority low level driver and normal priority user interface process.

Of course there is! How do you think FBB's BBS runs on Linux? It just uses AX.25 sockets to interface to the AX.25 protocol that interfaces to whatever hardware driver you have underneath.
Read before you bark.

That is why Linux coders are not interested. These are a different group of people. Usually not seen near proprietary protocols and boxes.

In most systems (Windows being a slight exception because it tries to offer backward compatability with real mode, with complicated CPU mode switches as a result) you can do many realtime things without involving the scheduler at all.

Just as you can (except in Windows) handle interrupts from a fast serial card without losing some, while the higher level system does not have a real time scheduler.

The thing to do is write all realtime code as statemachines inside the driver, and make sure that every event critical to the realtime operation of the system is triggering a hardware interrupt (no polling).

Then, you can do everything in the interrupt handler for that specific device, without involving the scheduler and thus without getting problems on a non-real-time system. The only prerequisite is that the system does not run long sections of code with interrupts disabled. Windows does.

The wellknow Baycom modem operates this way! It does all its activity in a serial port interrupt handler, triggered by "transmit register empty" interrupts that result from sending dummy data. This is the timing reference for all the state machines.
Its driver does not need to do any context switching, the most it needs to do is signal an upper layer that it has put another received packet into a queue, or that it has taken another packet from a transmit queue. The code running in user process space can then use that trigger to send more data or read the received data. That is not so real-time-critical.

It seems there is now a bit of tech. information out on Clover:
 http://www.halcomm.com/techdocs.htm
esp. http://www.halcomm.com/docs/e2006.pdf

Whether it's sufficient to do an implementation or not, I'm not
sure..

Are there any protocol details available for Pactor-II ?

That is great. It is also the reason that PACTOR and the other ARQ modes are doomed to extinction. The owners of the protocol patents refuse to license to other makers (at least at a reasonable fee) so you can't even buy ONE TNC that does them ALL. It is a ridiculous situation with all on a different standard. I quit and gave up on TNCs long ago and so have most others. I don't miss it one bit.
For anything you really need on Ham Radio the sound card programs provide it.

If you need error free transmission of data, use the internet.

Cool! Do the PACTOR-II and CLOVER drivers exist?

> Read before you bark.

The topic was PACTOR-II and CLOVER.
Can you point me to those drivers?

So why do they keep advocating Linux, even when the topic
is those proprietary protocols and boxes?

That level of information has been available for awhile.

> Whether it's sufficient to do an implementation or not, I'm not
> sure..

What's missing is the data structure of the frames.
i.e. the internal format of the CCB and data frames.
Also missing are the details of the error correction coding.

> Are there any protocol details available for Pactor-II ?

I've not seen much, others may know of some.

> If you need error free transmission of data, use the internet.

It doesn't work too well when the phone lines are out or if you're at sea or if you are located in some remote area with no phone service.

It would also seem to me that error free transmission using a sound card is completely possible. It's the timing requirements of Pactor and Clover that are a problem. A completely new protocol could work in a Windows environment if you are willing to relax the turn-around times for the ARQ (perhaps a modification of AX25). Packet lengths could automatically change so that when error rates are low you send long packets to improve the throughput and when error rates are high you send short packets to get them through and take a hit in the throughput. Some type of numbered acknowledgement system would probably help as well so that the sending station doesn't have to wait for an acknowledgement for a packet before sending the next one.

It may be of interest to some there is a pactor program that works with a soundcard. It was written by K6STI and runs under dos. Ritty 2.38. I've had it for a few years now with no problems.

This sounds like a very interesting idea. Take some of the ideas from
PACTOR-II, and some from CLOVER, and munge the ARQ timing
so longer delay (and some jitter) will not cause serious problems.

CLOVER can use three packet sizes now, and there is no reason
I can think of that would prohibit wider variation.

A lot of work though ...

Another one suplement:
I don't run Baycom from Windows and this screen saver is Baycom screen
saver.

Thanks, Boro 9A3KB

Looking for suggestions regarding the interface
necessary for the stacking of TNC nodes using
some technology other than a pound of diodes.

Any input, other than the use of computers and
sound cards, would be really appreciated.

Thanks de John

There was an article, maybe in PSR, back in the mid to late 80's. The idea was a small PCB with some 1488/1489 and a small herd of logic chips to manage the contention for the shared RS-232 bus via CTS/RTS.

The problem only occurs if the aggregate data rate of the TNCs exceeds the data rate of the shared bus. This can happen, for example, if there are more than 2 TNCs running at 9600 and the RS-232 bus is run at 19,200 or slower.

One could envision running the shared bus at a much higher data rate, muxing down to the TNC data rate for each TNC, and having a bit of buffering. But now you are close to building "a computer" :-)

My own opinion is that it is a lot simpler to use a computer for this function, and to put the protocols there as well, which also gains you the advantage of a single node list, single routing table, etc. etc. The computer could be some stand-alone single board device. This was done with the Xerox 820 boards in 1985. Should still be references to this work lurking somewhere under keywords like "dual port digipeater" and "TEXNET".

I made the assumption you are talking about AX.25 and NET/ROM protocols, with the TNCs talking to each other via the NET/ROM serial protocol. Situation might be slightly different for other radio protocols or other serial protocols. Someone will certainly mention FLEXNET.

Check out the "COAX LAN" by PacComm. We have been using it on a 6 TNC
node stack for the last 2 or 3 years with no problems.

many thanks to all who have read this message, I want to install this tape drive in my packet computer, unfortunately I have no software for this drive, sankyo USA can not help, and I have tried the web, but to date have no luck.

The unit is a scssi drive, any assistance would be appreciated.

My email ad is vk3jd@bigpond.com or by packet at vk3dse in Melbourne.

Regards
John.

LDAP might be a good solution. I haven't worked that much with it. The only time I tried I found the learning curve to use the libraries was very steep, but I will take another look.

Thanks

every frequency between 1 an 20 MHz is OK
```

Supply: 5V
Overall stability: <=3 PPM
Output: preferable HCMOS/TTL

but i would prefer the folowing values: 4, 8, 16 MHZ

i think your thoughts go more toward 13 MHz, right ? ;-)

This might work. Maybe the lookup program to pick off
the prefix and use it as a sub domain to delagate lookups.

The issues I see with this is:

1. difficult to added to application programs
2. delagation, might can be solved
3. difficult to automate. This too can be solved.

The #1 is the biggest issue, but it may have a solution.
I will check this out too.

thanks

That's right, especially since we already have a candidate domain, AMPR.ORG, where the next lower domain element (i.e. the "x" in "x.AMPR.ORG") is generally supposed to be a callsign. Although intended for just the packet radio network, nothing says that we must limit it to such if the local IP coordinators or Brian Kantor himself (the master maintainer of the domain) allows us to open it up for such.

The above forgot to mention CNAME-RR's, as in:

```
www.w6nut.ampr.org.    IN   CNAME    www.435.org.  ;controversial example
```

Of course, if there's no domain-to-domain mapping as there is for some URL's (e.g. www.x0x.ampr.org => ww.qsl.net/x0x), there can still be a "dummy" RHS which then gets resolved at one of those URL web-redirection services.

As far as calls=>e-mail addresses, well, the FCC has in one of its OPTIONAL licensing fields a field for the licensee's e-mail address. Granted that this takes care of the U.S. only, but why someone can't bother to do a lookup there is beyond me. (Remember that DNS mail services cannot resolve to a mailbox, only to a domain).

Jarno -

I sent Pac Comm an e-mail message and was told that the COAX LAN product was discontinued and is no longer available.

Does anyone else have any ideas regarding a hardware solution to "stacking" nodes? Hank mentioned the '1488/'1489 method. Any other ideas out there that do NOT require a computer?

Thanks

John

Some considerable discussion about this many years ago.

I notice some MX records now, so perhaps Brian (et al)
have moved away from the hard line taken previously.

The biggest question would be how to access that data.
i.e. allow everyone to update their own data.

What happens when that ham forgets to pay his ISP?
Or when he changes ISP? Or gets bored?
The answer is probably distributed and replicated databases.
As mentioned by others, LDAP and DNS both have this property.

> >Have you looked at the ARRL solution?
>
> What ARRL solution?

An email mapping server, which also contains any other information
you want to put there, based on an address like w0rli@arrl.org
(or might be arrl.net ... didn't pay much attention).

> >How about switchboard et al?
>
> switchboard?

One of the many online information services.
Stick a "www" on the front, and a "com" on the back.
switchboard, net-fridge, four11 (eaten by yahoo, but the url stil
works), dozens of others. With many of them you can "register"
some name, and associate other information with that name.
Interface is http of course, with no xml to define the client API.

> The last thing I won't to do is reinvent the wheel. If there
> is a possible solution out there I am willing to look at it.

LDAP is designed for this sort of thing, but has one problem.
Like X.400, it is gross overkill for the problem at hand, not
to mention rather hard to maintain and code against.

Way back in the olden days, when WP was first discussed, I
looked at a lot of different ways things *might* be done ...
... and then did it differently because in 1984 nothing had come
together as much of a standard.

Note that WP was designed to handle exactly the kind of thing
you are looking at: various information in a database linked to
a callsign as primary key, with the ability to do queries via some
network connection (RF or internet). Some of the lessons
learned with that distributed database should be useful, and
sparked a few of my comments.

In my opinion, the three most important issues to address are:

1. Ownership of the database. Who (or what organization) has

the final responsibility to keep the master copy of the data.

2. A good and simple API so software authors will use it.

3. Good marketing to get hams to push the data into the database.

For everyone's reference:

arrl.net: Any [current w/ dues] ARRL member can get a mailbox in this domain.
arrl.org: Only ARRL officials (directors, staff, OO's) can get this domain.

I'm not certain how far down in their organization the second one extends.

Greetings,

Since I started the Trusted QSL project it has become clear
to me that many different types of amateur internet services
has the same problem. How do I connect a call sign to
an E-Mail, web, logbook server and public keys?

I think I may have a solution. Call Sign Address Server (CSAS).
This would work along the same lines as DNS. There would be
a few root servers which will delegate request to "closer" servers.
This could one for that country or call area.

Any thoughts?

Did you tire speak in to the microphone during 48 hours of contest?
Does your outraged neighbours knock on door of your shack?
Does your wife cover up her head with pillow during night in order to
doesn't listen how you call rare DX in pill-up?

Free yourself from problems - use the AAVoice!

Once saved several sound files into the computer you would able to finish
work telephone contests didn't say a word!

Download it ftom http://www.dxsoft.com/aavoice.zip (~600k)

More details  http://www.dxsoft.com/miaavoice.htm

Should you model it more on LDAP?

I think I may have a solution.  Call Sign Address Server (CSAS).

I seem to have a lack of success with JVComm and Windows 2000. I get
JVComm to control the sound card level but there is no audio showing
in JVComm.   Anyone have any ideas.

Who will pay for the servers?
Have you looked at the ARRL solution?
How about switchboard et al?

Would need interface for access by logging software.
i.e. needs an API, perhaps http.
Who will create and maintain the specification for this API?

What level of activity is expected (hits / day)?

What percentage of use is required to make it useful?
i.e. if only 5% of hams are listed, it's not yet useful.

How to convince hams to actually input their logs?

Just some random thoughts ...

actually, you could use DNS virtually unmodified to do this. Instead of posting a bunch of A, PTR, or MX records, you use some of the less well-known features of bind such as TXT records.

totally rigged demo:

```
dig ka1eec.us.callsignlookup.com

Check if you have an additional audio device in your system. In my case there was one associated with my modem. Somehow it disabled all soundcard applications until I manually removed it.

I have in the machine two sound cards: Echo Gina 8 channel card and
the standard sound card (Terratec Base 1 at present). If I remove
physically the Terratec card ten JVComm still does not see the echo
card at all so I cannot use that card for JVComm. If I disable the
Echo card there is no improvement, I still cannot see the audio from
the Terratec card. I can not physically remove the Echo card as it is
in constant use for work!

That is one of the problems with the DNS solutions.
DNS isn't configuration isn't for the faint of heart.
The programming API doesn't seem well define either.
How does one get the MX record for a given name?

LDAP may work but it is a very heavy library.

This doesn't really solve the problem. We need a lookup server
that it doesn't matter where your email or eqsl server is you
can find it.

Yes, I agree whole hearted! I don't think DNS would be flexable enough.

>(or might be arrl.net ... didn't pay much attention).

This doesn't really solve the problem because you still need to know that that ham has a ARRL mail forwarder.

>LDAP is designed for this sort of thing, but has one problem.
>Like X.400, it is gross overkill for the problem at hand, not

That is what I have found as well. We might be able to create a wrapper to the complex code.

>In my opinion, the three most important issues to address are:
>
>1. Ownership of the database. Who (or what organization) has
>the final responsibility to keep the master copy of the data.

I would say more ownership or authority of the domain, but like the DNS model responsibility can be delegated. Still there need to be root servers to delegate.

I am willing to help get this started and can host it for a while.

>2. A good and simple API so software authors will use it.

Also the API must use a non-restictive open source model. To help promote the use by all software authors.

>3. Good marketing to get hams to push the data into the database.

I agree completely. Very good comments Hank!

Does anyone know how to wire an Icom T7A (or T7H) HT for packet? The owner's manual doesn't really address packet use.

> The programming API doesn't seem well define either.

Depends how one thinks about things. What is actually defined
is an interchange protocol (you send "this" and the server will
send you back "that"). I've tended to make my own library
of functions to drive the protocol, and expose an API that
I happen to like. Probably everyone does this.

> How does one get the MX record for a given name?

One can ask for specific record types in the query.
For DNS I think the harder question is how to administer the
servers, and allow everyone to update their own records.
DNS servers are usually very tightly controlled, with updates
checked by an administrator before they are applied.
However, I can see ways to automate everything, and the
same issues of authentication apply no matter what database
technology is chosen.

> LDAP may work but it is a very heavy library.

Exactly what I meant. Overkill for what is needed,
so perhaps forget about LDAP.

Sorry I didnt mena you. I should have been more specific. I meant our good
friend Mr Stussy and his linux comments.
Thanks agian for your reply. I am looking for a "real" micro tnc now that I
can mount to the back of my laptop, size is almost a critical as the OS.
Ok, Thanks again.
Julian...

And Windows doesn't need maintenance? Considering that Linux installs flawlessly, yet I've seen the "BSOD" (blue screen of death) come up during the INSTALLATION of Windows '95 23 times on the same machine during the same installation process, I stand by my statement.

Considering all the obscure commands and such, installing Linux's AX.25 support isn't more difficult than installing the equivalent into the autoexec script for any version of NOS. However, try adding external programs to NOS.....

Why do we need to run that exotic hardware, when we can run normal hardware under Linux and make it do exotic things!   ;-)

What frequencies and modes on HF?
Show me Linux doing "exotic things" on long haul HF paths.

I'm sorry you have such trouble understanding the simple and obvious
installation of the most popular operating system. Most people, even
those with no technical training, handle it with ease. Heck, even my
mother (age 86, never owned a computer before) managed it without
any problems. But then she is pretty bright, and knows how to read.

I've had no problems whatsoever installing Linux at all. Oh, you mean Windows!
I've had other machines install Windows without problems. It's NOT a matter of
my understanding - it's a matter of bugs, defects, and the lack of Microsoft to
program around and expect that a machine may not be their perfect model of a
PC. I've also had machines lock up during the hardware detection phase.

Additionally, Windows is not a fault-tolerant OS. One little problem and
sometimes it means REINSTALL. Linux, like all UNIXes, is fault tolerant. How
many times to you have to reboot with Windows during installation of [any]
software? Linux, except for kernel upgrades, never needs to reboot.
Additionally, except for an occasional cleaning of the system logs, the only
"maintenance" a Linux system needs is usually software upgrades. You make it
out to be some obscure OS. It isn't. Unix, of which Linux is merely a
variant, has been around since 1972. Ever wonder why it's still here, yet
Windows needs to be changed about every other year....?

Tell me what hardware those modes use (chipset, etc.) and I'll tell you if it's currently suppported. Generally, drivers are the responsibility of the manufacturer. Can you run those modes on a Mac? You see, shortsightedness of the manufacturer is the problem; not the OS platform.

Linux supports regular TNC's, the defective Baycoms, and even AX.25 emulation over ethernet (BPQ mode too). Try running a Baycom TNC on a Mac?

You really don't know much about digital radio I guess.

Here are some free clues (most hams can ignore the following, you probably know all about these modes).

The hardware are ... ready for this? ... CLOVER controllers and PACTOR-II controllers! They connect to ... um ... something called an "RS-232C serial port" ... many computers have those! Programs called "applications" send commands and data to the controllers, causing them to send that data, and to receive data, across radio links.

That data might just happen to be (just as one silly example) messages or bulletins that could (if one wanted to) be moved to and from messaging systems such as the ham radio BBS network, or the internet, or any other messaging system of your choice. They have been used for this purpose over ham radio for many many years. There are other controllers that handle other protocols, I'll mention them later.

> Linux supports regular TNC's, the defective Baycoms, and even AX.25 emulation
> over ethernet (BPQ mode too). Try running a Baycom TNC on a Mac?

If that is all it supports, it is useless for the desired application.

How about plain ordinary RTTY? PACTOR-I? PSK31?
Are there Linux applications that support those modes?
There are such applications for Windows, and, with the exception of PSK31, also for DOS and for CP/M and for (name your favorite operating system but forget VM and ISIS and QNX e.g.).
B1FF can even use his old C-20 if he wants to!

And that is the main problem with Linux. It may well be a nice OS for running internet servers (but was never my choice: Solaris and HP-UX are much more stable and have much better support), but the applications and support are just are not there yet for Linux.

My point, of course, is that for support of emergency communications, one wants to make use of all the things that hams can do. The OS of choice is the one that provides the maximum number of options.
It ain't Linux.

Ok, I'm new to RTTY.....with that said.....

I'm using PKterm99 software to my AEA PK-232mbx tnc and to my Icom 756pro using an MFJ microphone/tnc switch.   I'd like to use the 756pro's RTTY mode which seems to copy RTTY better than when I just use the LSB mode.   But when using RTTY mode when I switch to transmit I'm only putting out a solid carrier with no modulated RTTY signal.   What the heck am I doing wrong?
If I switch to LSB mode, I can both receive and transmit RTTY but I'd prefer using the 756pro's RTTY mode. I even tried connecting the FSK output on the pk-232 to the ACC1 FSK on the Icom but no difference.   Why am I only transmitting a carrier when I hit Send in the 756pro's RTTY mode?   Any advice for this digitally-challenged ham would be appreciated.

Thanks,
David,K4ZZR

What I have seen for those is things like that custom HAL-9000 board. There is no RS-232 port on there.

However, if you're talking about a regular TNC (such as an upgraded PK-232) that supports the mode in hardware, Linux can easily support it. The TNC is responsible for firmware level conversions (i.e. level 1) from KISS mode, and Linux supports KISS mode.

> That data might just happen to be (just as one silly example) messages or bulletins that could (if one wanted to) be moved to and from messaging systems such as the ham radio BBS network, or the internet, or any other messaging system of your choice. They have been used for this purpose over ham radio for many many years. There are other controllers that handle other protocols, I'll mention them later.
>
> > Linux supports regular TNC's, the defective Baycoms, and even AX.25 emulation over ethernet (BPQ mode too). Try running a Baycom TNC on a Mac?
>
> If that is all it supports, it is useless for the desired application.

I in no way said that the above was wholly inclusive of all it supported. In fact, I have made no claim whatsoever to what it doesn't support. Your continuing obsession to read things into what I have said or omitted shows the light of your true nature.

> How about plain ordinary RTTY? PACTOR-I? PSK31?
> Are there Linux applications that support those modes?
> There are such applications for Windows, and, with the exception of PSK31, also for DOS and for CP/M and for (name your favorite operating system but forget VM and ISIS and QNX e.g.).
> B1FF can even use his old C-20 if he wants to!
>
> And that is the main problem with Linux. It may well be a nice OS for running internet servers (but was never my choice: Solaris and HP-UX are much more stable and have much better support), but the applications and support are just are not there yet for Linux.
>
> My point, of course, is that for support of emergency communications, one wants to make use of all the things that hams can do. The OS of choice is the one that provides the maximum number of options.
> It ain't Linux.

And with the records of bugs, crashes, and such, it certainly is NOT any Microsoft product either.

Good Morning!

I am not sure this question is going to make sense, I probably lack the basics to ask the right questions, but hopefully I'll pick up what I need over the next few months.

I am planning on going on a 2 months sailing trip. I'd like to stay in touch (email) during that period, if not daily, at least more often than the frequency of Internet Cafes. We'll be sailing in the Indian Ocean, mostly around Madagascar, so the chances of finding a connection around there are quite low.

So, the owner of the yatch I'm sailing on said there's a gizmo that should be added to his SSB radio to get Internet. I know his understanding of the technology is very sketchy, and I understand basic principles, however, I don't have a practical experience of what's allowed and what's not in SSB. I can setup a slip connection, and I guess that's probably what's going to be needed. I'm pretty sure I could even get uucp going, if I had to. What I'm missing are really the bits between the SSB radio output (do we need something other than the audio output?, any specific requirements for the radio set?) and the computer.
Then, there's the ISP fees. If such a link is feasable, what's on the other side? Would we have to set-up a terrestrial station on _this_ side, connected to the Internet or is there a public ISP service available on SSB?

Thanks for any help, you're welcome to send me email if you think it would help, just remember to remove the "nospam".

I set the FU to rec.radio.shortwave, feel free to indicate a more appropriate ng for this discussion.

Regards.

Daniel   :-)

Hank's likes to stress that Linux does not (in his view) the protocols that he (in his view) needs. But instead of rectifying that situation he continues to develop his software for DOS, and than claims that DOS is the only usable platform for the decades to come.

Of course his grandma (who can read) could have installed Linux on her computer just as easily, and could have done it for his group of people that are now going to use DOS (and apparently cannot read).

And Hank could have ported that application he so desparately needs to Linux. When it is now running on DOS, that should not be too tough.

Rob

Using the 756PRO's RTTY keying input on the ACC(1) connector is the way you want to do it. The PRO must be in the RTTY mode. The PK232 FSK outputs a DC voltage level into the PRO's RTTY keying input, normally >2.4V for mark and <0.6V for space. I don't recall if the PK232 always outputs the FSK signal or if there is a parameter that must be set to use it.

When you say that you are outputting only carrier with no modulated RTTY signal that would mean that the PK232 FSK output is not controlling the PRO's FSK input. How are you verifying that you do not have any shift (another receiver)? FSK will be a steady carrier which is shifted in frequency in step with the mark/space input signal.

-----BEGIN PGP SIGNED MESSAGE-----
Hash: SHA1

Hi all, and the question is, how the heck do you set up an actual working packet BBS and get it to communicate with the outside world?

With that said, I've done my browsing, read up on the various packages, W0RLI, TNOS, FLEX, NOS, THE NET, etc and yet the one thing I haven't really found is a good, down to earth, step-through installation/set up guide, explaining what to do, why you do it and testing it to make sure it works type of site.

I've determined my best choice is a DOS based solution that will run under OS/2, probably W0RLI or TNOS, but around here most of our packet systems run message forwarding, on NET/ROM nodes, and no real required TCP/IP stuff.

The hardware is no slouch, 700 mhz P3, 30 gigs hard drive, 4 serial ports, Kantronics 9612+ and a 10 watt IC-22 and a 'brewed copper cactus.

The TNC/Radio/Antenna work fine connecting up as a user, so I know that works, but besides the fact that I do have an IP, where to start and how to get there is my problem. Anyone care to toss out some much appreciated guidance?

73, Ramsay, KC2GMW

> Yes. Abandon all hope and switch to Linux. JNOS is 10+ years old.

Better still, use JNOS under Linux where it compiles very nicely (thank
you) and runs reliably. My system was quite happy for the 4 weeks I was on
holiday last month where is shifted over 350megs of data over 8 radio
ports, imported several thousand bulletins and provided the radio interface
to HTPP convers, bind DNS and Apache web server.

But beware - use JNOS for the tasks it was designed for - not the 'extras'
such as convers and web server that have been added in more recent years
and have 'bloated' the code base somewhat. For being able to adapt the
TCP/IP timers and retry algorithms to a noisy radio environment and as a
AX25 to nntp/smtp gateway it is excellent. It also provides a BBS front end
for those AX25 users who haven't yet 'discovered' the fun of TCP/IP and the
fact that you can use your favourite GUI behind it.

BTW: my favourite GUI is KDE and having just upgraded to version 2.1 I can
say its excellent!!

WoW!
That would be cool!
Where do I get the appropriate software?
Are there any applications that use the drivers?

Really really clueless.

PTC-II, DXP38, D4100 just for a start.

When you visit your local ham radio store, ask them to show you
a DXP38. There was one right up front in the display cabinet the
last time I was in HRO.

> However, if you're talking about a regular TNC (such as an upgraded PK-232)

Guess you were not paying attention.
The question was not about "TNCs".
If you don't know the answers, just say so.

So answer the question.
Perhaps you just don't know?

I guess you really just don't know much about Linux either.

Nobody has asked me for Linux support.
Guess that is because I'm interested in ham radio.

> Of course his grandma (who can read) could have installed Linux on her
> computer just as easily, and could have done it for his group of people
> that are now going to use DOS (and apparently cannot read).

Both my grandmas passed away over 25 years ago.

If my mother installed Linux it would not be very useful, even if she
did have a ham license. She lives 3200 km from here, we would need
an HF link. Linux does not support any useful protocols.

> And Hank could have ported that application he so desparately needs to
> Linux. When it is now running on DOS, that should not be too tough.

Yes, it would be easy to port to Linux.
Why would I do that?
Of the few Linux users on air here, only ONE has managed to get
it to actually work and send tcp/ip frames to other tcp/ip systems
using ham radio. The rest use simple terminal programs over AX.25.

Does it do PACTOR-II and CLOVER?
(Nobody seems to know ...)

Actually, I believe that the latest version of F6FBB under Linux supports
the SCS PTC-II in
PACTOR-II mode (including scanning). It is also possible to communicate in
IP (using
SLIP) over PACTOR II - see
http://maflink.maf.org/Support/noframes/Support/Radio/ptc2slip/pactor.htm.
I am currently working on getting an HF/VHF-Internet gateway running to
support connectivity
to some Federal agencies who don't/won't use radio messaging systems... :-(

And no, I am not a Land Line LID - I have spent the past two years working
(successfully) to get the Army MARS
packet network in my area on its feet (having pretty much given up on the
amateur community -
it's like herding cats). I agree with you that radio end-to-end is
certainly greatly preferable - just not always
possible in the short term.

73's, john

I do not have a 756 Pro, so I cannot be specifically helpful, but Bob Lewis seems to be giving you the right input.

You definitely want to use the accessory port in the back so that you can use FSK. You want to be able to use all of the narrow filters while copying RTTY or Pactor.

As Bob pointed out, it sounds like you are not keying the FSK port with the "shift." Make sure that the "shift" pin on the PK-232 is keying the "shift" input on the 756 FSK port.

Hope to see you on Pactor soon! The PK-232MBX is a decent TNC for Pactor. Give it a try!

Thanks John, you're the first to provide some actual information.

Will pass this along to the folks interested in long haul HF links
for their emergency comms. Exactly the info they are looking for.
The links will run both on ham radio, and on some commercial
freqs in the 4 MHz range. They get the fun of sorting out how
the messages need to be handled (smile).

Bob...thanks for the info. Yes, I'm using another receiver and only hear the solid carrier with the 756 in RTTY mode.   When I switch to a sideband mode, Rtty works fine (via the microphone input).

The ACC1 pinout for FSK in the Icom manual only shows these pinouts:
2 - Ground
3 - PTT
5 - AF Input
6 - Squelch (don't need that)
7 - RTTY keying

The FSK DIN on the back of the pk-232 shows:
1 - FSK N
2 - GND
3 - MARK
4 - FSK R
5 - SPACE

The PSK-232 manual only shows 2 of these pins being used, Pin 1 (for Normal FSK) and Pin 2 (for ground).   So those are the only two connections I made to my 756:

(Pk232) Pin 1 to (756pro) Pin 5
(Pk232) Pin 2 to (756pro) Pin 2

So, it looks like I've got output from the radio to the TNC but no connection from the TNC output to the radio?   If the Pk232 Mark and Space pins are supposed to be used, what do I connect them to on the ACC1 of the radio? Should I run both of the Pk232's Mark and Space pins to the 756pro's Pin 7 (RTTY keying)?

Obviously some of the other pins should be hooked up but what to what?
And, should I assume that the connection between the 756 ACC1 and PK232 FSK in/outputs will bypass the other connections made via the TNC's "Radio1" connector and the 756's microphone when the radio is in RTTY mode?

Again, thanks for your help. What would we do without hams helping hams?

73,
David, K4ZZR

Roger...thanks for your reply. After writing my least response, I think I know where the problem lies although the PK-232 manual doesn't actually show a connection from the TNC's FSK Mark and Space pins, I'll bet I'm supposed to run BOTH of those to the 756pro's "RTTY Keying" pin 7.   Whatdayathink?

73,
David, ,K4ZZR

p.s. I've been able to receive some Pactor but haven't tried connecting to anyone yet. Need to do a little more reading on that mode.

David,

Might want to talk to John Douglas at Timewave. They could give you the correct pinouts to hook the FSK lines up to the IC-756 pro... also might want to get Gary Fiber at Icom in on the conversation too. That way, it can be fixed up real easy and fast. FYI, no changes are needed in PKterm '99 when going from AFSK to FSK.

If I'm not mistaken, Gary has a PK-232 also.

Hey Fellow Amateurs...
Do you have a Senior family member or disabled person that wants to
LIVE AT HOME and NOT an expensive resthome???

Do you have a friend, spouse or loved one who live's at home alone
and wants both SECURITY and MEDICAL monitoring FREE OF CHARGE?

Peterson & Associates has aquired about 100 of the long sought after,
NO MONTHLY fee, WIRELESS Pendant, emergency Console systems!
These sell RIGHT NOW through Retirement Groups nationally for 199.95

See our web ad.... www.ratestuff.net/medical.html -they sell there
for 69.95

Read on to get yours through our Ham Radio sales outlet-dealer in
Salt Lake City, Utah for 59.95, plus shipping and any taxes
applicable.

These are Complete Security and Emergency Medical HELP Dialer -
Console
systems that consist of a 100' Wireless Pendant that a Senior or
disabled

person can carry around the House. These are GREAT for Parents, the Elderly or anyone that wants to stay at home, giving family members a peace of mind. These are provided to monitor an alert Friends and Families through an emergency dialing system, witout ANY MONTHLY MONITORING FEES, EVER!!

These are like the "HELP I"VE FALLEN and can't get up BUTTONS" advertised with 30.00 per month monitoring fees, these units can be programmed easily with up to THREE Family members telephone numbers, or even 911 or Police where accepted.

Once the panic button is pressed, the console dials out and delivers a pre-recorded emergency message to your loved ones.

These UNITS are for sale to Ham Radio Families and their friends for a special NET price of $59.95, plus tax & shipping.
VISA, Mastercard and ATM cards now accepted!!

Just ask Bob for the special price on the PANIC DIALER's

I haven't the foggiest idea - and why should I know since that wasn't the original question anyway. I'm too busy with 9k6 and higher speeds to be concerned about operations on the DC bands in any case...

FBB for Linux naturally supports the PCI-II. Any of the Linux software that supports WA8DED type host-mode also does implicitly. I'm in the

process
of developing some Linux-based gateway software that will integrate
(as best as possible) the PTC-II into the existing Linux ham application
space.

Terry

> Keying" pin 7

As I recall, the mark and space connections on the PK-232 are outputs
to drive a scope for tuning. The FSK input on the PRO is pin 1 not pin
7.

How does that compare to the radio of *NOS users to plain AX.25 terminal
program users that use DOS and Windows? Probably similar?

Well, excuse me. Not everyone has an HRO nearby. The store I was most
recently in (within the past month) was Jun's, and they don't have that on
display.

The question is about data controllers. Since when is a TNC not one? (Granted
that it's not the only type, but your reply makes the reader infer that you are
classifying them as something else).

I don't claim to know 100% of everything about Linux. It's "open source"
developement clearly implies that perhaps someone has in fact implemented a
driver for all this obscure hardware you're talking about, but there need not
be any indication that such was ever shared with the world.

Apparently more than you do.

Here's something that Linux does support that I haven't seen anywhere, except
for some custom PROMS for some TNC's: A "Rose" network.

Here's something that Linux doesn't support: "Flexnet" - which does exist for
Windows. You see, I'm willing to admit that there's something that it doesn't
do.....

For the record, apparently raw AX.25 (or even the extended AX.25 with a 128
packet window), Net/ROM (classic and BPQ), ROSE, and TCP/IP are not useful
protocols according to Hank.

Just because you live in a neighborhood of failures doesn't mean that you have
to be one too.

In my part of the world, at least half (if not more, but not all) of the
statios running TCP/IP over AX.25 are doing it via Linux. Only about three are
holding out with JNOS under Windows. One (W6TRW) is doing it by running JNOS

```
under Linux, but Linux is doing the packet switching.  The JNOS BBS is
"attached" via a virtual serial port and does no routing of its own.

Well, that depends on the crystal frequency in the particular
transverter you use, doesn't it?

Excellent Terry!
Glad to hear this.
PACTOR-II is a good protocol for doing things like HF gateways ...

You might try connecting to my tcp/ip system sometime.
Lots of ways to do it, but you never have.
Wonder why?

> In my part of the world, at least half (if not more, but not all) of the

"half" means "one"?

Um ... no ... it depends on the crystal frequency of the particular
transverter that was offered for sale. That is what I asked.
That is what this thread is about: some gear for sale.

If you don't know ... let the fella who is selling it answer.

You want applications?  JNOS and F6FBB's BBS have Linux versions.  There ar=
e
DX-cluster and some APRS stuff too.  There's 4 - I leave it to you to go fi=
nd
the rest and not waste my time saying there's nothign.

"Hank Oredson" <horedson@att.net> writes:

> Does it do PACTOR-II and CLOVER?
> (Nobody seems to know ...)

Depends on how you define 'do' :)

There are, to my knowledge, no "soundcard" implementations of neither PACTOR-II nor Clover for Linux.

The hardware, delivered by Halcomm and others, do have an RS-232 serial interface, which of course can be interfaced to any kind of computer (with a serial port).

There seems to be two serial protocols for talking to Clover devices (URL:http://www.halcomm.com/docs/e2005c.pdf). I have not seen any software for Linux that implements the proprietary protocol (It's not very complex, so it shouldn't be hard at all to implement given interest and some programming skill). The other serial protocol uses a subset of the Hayes AT command set. Most terminal programs supports this (even for Linux :)

Any device supporting a text-based serial protocol (like TNC's, PK-232 etc. etc.) can of course be used from Linux, with programs like 'minicom', 'seyon' and several others.

What using these "generic" programs won't give you is the menus and controls, for easy operation, as the specialized programs do. There is however possible to tailor these generic programs do to a lot of what you want.

As for other modes -- there exists several soundcard solutions for PSK31. Thomas Sailer, HB9JNX, has experimented with

RTTY, AMTOR/SITOR and PACTOR-I for soundcard.
(URL:http://www.ife.ee.ethz.ch/~sailer/ham/linux/hf.html)

There exists drivers for running packet radio (AX.25) from
soundcard (at least 300 and 1200 bps, maybe even 9k6?)

I'm looking for help from someone who have experience with specific hardware.
I'm using HEWLETT PACKARD Omnibook 300 and 1200bd modem based on AM7810 with serial connection. The modem is tested and work correctly with another notebook (HP Omnibook 4100) or standard PC. The tested software are Baycom and Grafic Program.

The better way to see the problem is looking the traffic monitor. I can receive the traffic
in the interval when the program is just starting. When the program is started on,
I can't see anything new on the traffic monitor. When the program (Boycom) goes to sleep
mode (screen saver) the monitor is received new traffic. After I touch the keyboard

and deactivated the screen saver, traffic on the monitor stooped.

Any advice for this problem would be appreciated.

Thanks,
Boro, 9A3KB

Turn off the screen saver and don't run Baycom from Windows.

No. Pactor ARQ timing requirements are far too critical to function
under the Windows operating system. There is a DOS program that will
run Pactor. Even then you have to go through a process of calibrating
it to your particular PC.

In article <3A9562D8.760DD83A@shecora.com>, Darryl Wagoner
<dwagoner@shecora.com> writes:

>The other issue is Trusted E-QSLs will help streamline the awards process.
>Not only in the amount of time it takes to process the award, but in
>the time required to collect the QSL cards.

I've already been notified I'd be a pariah if I opposed this idea, so my continued opposition can't hurt me anymore, I guess.

There are four reasons (at least) why this idea will not be widely adopted.

#1) Traditionalists (like me) who place high value on paper QSLs will not participate in an eQSL scheme.

#2) Most major DXpeditions derive much of their funding from donations received in the QSL process. They are unlikely to participate in scheme which diminishes that funding channel.

#3) Perhaps less than 50% of the DXCC 'entities' have the required telecom infrastructure to support routine participation by the average resident.

#4) ARRL is well down the path of deploying LOTW which will become the DXCC "eLog", and thus the 'solution of choice' among serious DX players. Any other scheme is second-tier right out of the box.

73, Pariah, K0HB

Good luck on this one now!

Walmart has been selling the RCA DSS recievers new with the 18" dishes for
$48.  This is the walkaway price with no programming, don't show them any
identifications, cash price.

Alexander - your question is still a bit vague, but I will give it a try...

Consider getting some inexpensive 2.4GHz wireless ethernet cards. Here in the US they are about $100 each, new (I got two used cards for $40 each at the Dayton Hamvention a few years ago). The antennas that come with them probably won't work, however you can easily build helix antennas. I built some 2.4GHz 6 turn helix antennas (more or less following the plans for a feed for a satellite antenna in the ARRL antenna book) for about $4 in parts. They were basically old copper overhead wire (30mm diameter), N panel mount connector, and printed circuit board stock.

The result? My neighbor and I have a link that works at about 89KB a second and we less then $140 invested in it.

If you would like a few pictures I could send them to you.

-James Jefferson

>
> I have two buildings with internal networks using linux boxes as servers for mail and fileservice. Now I have to set up a solution to connect these two buildings (about 500m distance) so that email is possible. The problem is that there is a river (small, but water) between them so wire gets no chance. I would be happy with about 50 - 100 kbit that should be enougth for email.

I agree with Darryl on this, in fact my correspondance with the ARRL regarding E-QSL revealed they are looking into this method. What is needed is actually an organization rather than individual. Historically, individuals will eventually quit or pass-on thus leaving the system "dead-in-the-water".

On the topic of actual "wall paper" nothing should prevent the use of these cards. In fact, if modeled after the currency systems of the world paper QSLs equate to paper money and E-QSLs equate to wire transfers. I like to collect paper QSLs but right now I have several countries on E-QSL that are worthless toward DXCC (the initial 100) that are badly nedded. In fact, one overseas ham was not aware of the ARRL stand and had actually sent me an E-QSL plus one through the slow and antiquated QSL Bureau System. (On that topic I have at least 3 envelopes on file - one for each postage change but nothing comes out. In fact the Bureau assistant manager for my call group will not respond to email inquires.)

The cavet for the organization accepting this responsibility is they cannot require membership to access. They could charge a fee for registration maintenance to recover costs.

kal

I agree with John. I like getting cards in the mail and I like to see REAL QSL cards that have some creativity. Some of the DX cards have beautiful pictures of their homelands, station, etc. Yes, they may cost us more (greenstamps to the DX stations) but there is a great thrill in getting overseas mail with the QSL.

Also, I think the ARRL should sponsor an award(s) the promotes real QSLing beyond what we have today with WAS, WAC, and DXCC - both stateside and international.

Regards,

Duffy - WB8NUT

There's no reason why the exact same QSL card cannot be sent as an
email GIF file.

I suspect that some of the reported decline is QSLing, besides the cost, is simply that for younger people, there is no longer anything particularly exotic about communicating with people in far-off places. The world has turned into such a small place that there is nothing special about seeing images, or getting things from the other side of the planet.

For example, my enjoyment of radio comes more from playing with the technology, and not really from "Hey! I just talked with a guy living in Denmark!" I suspect I'm not alone in that.

Sure they could. That is one of the great things about this model. It isn't one enity that is responsible. The CA (Certification Authority) is free to put any requirements they wish. What the awards sponsers can not be allowed to do is unreasonably restrict the use of a CA for validating public keys. This could mean that your local radio club could and should become a CA. They would have the burden of proof that they should be consider a trusted CA. If a CA does become "untrusted" their certificates would not be honored.

By using this model it creates a open market for CA and reduces the chances that one enity will end of with control over the whole thing. That is why I started this effort. To prevent a single enity from becoming the master of eqsls.

I just created a reflect on yahoo groups. If you are interest in this please join. thanks

Apparently Mr. Cotter Pin, you have never sent a DX QSL, they cost of "one Hellva" (using red neck vernacular) more than $0.34 to send. In fact it is now for just a basic DX QSL as follows:

sending envelope	$0.05
SASE	$3.05 (up to)
QSL	$0.15 (up to)
Total Cost	$3.25 (up to)

Now to qualify this "up to" amount, this card was sent to a German QSL manager. I would guess the average cost is around $2.00 per card, if an American Ham is being nice and trying to pay their way.

What I cannot understand is this issue "pisses you off" so much. It just people putting ideas up for evaluation and process improvement. Personally the cheapest people in Ham Radio I have met are the ones who show up to Hamfests and want to give one $5.00 for a piece of equipment that really worth several hundred. These people usually are trying to buy low and then in turn sell high at another Hamfest. This does not have one damn thang (using neck vernacular again) with the cost of QSLing.

I dont know what exactly your problem is but dont take it out on the rest of us.

lak

Hello All.

I reside deep down in the Pacific, New Zealand. Unfortunately I am the only 'Ham' who ownes Writelog.

If there is an Australian Amateur who has WL could you please contact me via my e-mail address. Many thanks.

Jim

DOVETRON regenerative RTTY Terminal Unit, model MPC-1000R-II. Top of the line commercial TU from mid-'80's. In addition to conventional loop output, it has EIA +/-12V and MIL +/-6V signal outputs for easy interfacing to computers or TUs like the PK232. Has cross "scope display" on front panel for tuning, can tune to widely varying mark / space frequencies and shifts. Can generate AFSK on set freqs.

Includes copy of manual for MPC-1000CR/T Mark II ("Tempest" version, which is a VERY similar unit).

19 inch rack mount, about 4 inches high. Front and back clean but some knobs are missing the metal disc insert. Top and bottom are scratched.

$140 plus UPS from ZIP 29860. Satisfaction guaranteed 10 days or money back less shipping.

Makes a neat tunable front end for the PK-232, which is how I am using my other one (have 2 of them).

How do you expect to get such attenuations when cable leakage is much
more than that above audio frequencies.

Found this issue to be true at in my college EE classes. The students are more interested in technology than who they talk with. One guy said he could call overseas on his cell phone from anywhere in the US without big antennas or expenses. The university Ham club, that started up 10 years ago, has been floundering with just a few people mainly interested in 2 meter autopatch calls.

Wire fraud is under FBI jurisdiction.

The Postal Inspectors will cease the unit for evidence and they money will be returned as soon as the investigation terminates due to court proceeding conclusions or the perpetrator make restitution. The bottom line is the radio unit will become property of the Federal Court System as forfeited as evidence by the victim and perpetrator. The fraud in this form of action is due to the US Postal Service being the conveyor of the medium of compensation, i.e. the Money, Check or Postal Money order.

Best form of immediate resolution will be negotiation rather than threats.

```
Both parties at this point from all I have read are "pissed off" and wanting

Such attenuators do exist. I have in the shack a 0-100 dB attenuator in 1 dB steps. It was manufactured by Pascall, UK, about 5 years back. I forget the price but it was quite expensive. Don't know whether the firm still exists. Built into a solid die-cast aluminium-alloy box.

Cable leakage does not increase with frequency - it decreases. Worst of all at DC and audio frequencies. Leakage occurs mostly at connectors. Use threaded types, not simple plug and socket. Impedance mismatch at connectors is no problem with attenuation measurements.

I have made measurements up to 160 dB at up to 5 MHz by comparison with variable attenuators. A 10 watt signal generator is needed. Without any extraordinary precautions it is possible to make measurements with an uncertainty of a few tenths of a decibel at 100 dB.

I have also made measurements with a precision of 0.001 decibels at frequencies up to 10 MHz. Such measurements are necessary to determining the loss vs temperature coefficients of components and systems when it is possible to vary the temperature only a few degrees C. A high precision is also needed when calibrating field attenuators against laboratory standards.

I guess that it must be quite expensive if you really get such
accuracy as you later claim, even in a controlled constant
temperature.

I also suspect that the VHF/UHF performance is not that spectacular
and since the original poster did not specify the required frequency
range, I originally asked about it.

>Cable leakage does not increase with frequency  - it decreases.
>Worst of all at DC and audio frequencies. Leakage occurs mostly at
>connectors. Use threaded types, not simple plug and socket.

DC and audio circuits generally have a much higher impedance levels
than 50 or 75 ohms used in RF circuits, so the capacitive coupling is
a much worse problem.  At very low frequencies the coaxial cable does
not work properly as a transmission line, thus the isolation is not
very good. However, due to losses at very high frequencies, the shield
```

no longer act as a perfect conductor and you can get different
currents flowing on the inside and outside of the shield.

>I have also made measurements with a precision of 0.001 decibels at
>frequencies up to 10 MHz.

I guess that must be the readout resolution in some comparative
measurements but not an actual precision. A 0.001 dB voltage ratio is
115 ppm (0.015 %), so I wonder how this accuracy could be maintained,
especially if some real power levels are involved heating the
attenuator.

Absolute accuracy should not be confused with precision.

To measure attenuation within "a few tenths of a dB" (at any attenuation level) entails detecting a difference between two voltages which are a few percent different from each other. This is an easy job for any voltmeter. Errors are not due to the comparing voltmeter but to the measuring components, cables, connectors and layout.

Accuracy entails comparison with a local standard. There will be uncertainty in the local standard in addition to errors introduced during the comparison process. There will also be uncertainties introduced at each calibration level up to the International standard.

Precision is related only to local effects such as signal to noise ratios. It is relatively easy to detect a difference of 10 microvolts between two voltages of about 1 volt each. This corresponds to a precision better than +/- 0.0001 dB

I am looking for small transceiver, which I can transport in a small case. I �d like to use it for the digimodes on 20 m band. The output power should be 5 watts or above. Since I have no time for homebrewing, it should be plug & play. Overhere in europe my search had no success.

Any ideas?

Check out the new Yeasu FT-817.

It is a 5 watt rig for CW and SSB

Hi Paul,

Precision, Resolution. These can be the same thing or different; however neither are a statement of accuracy.

When my old Drake TR-7 VFO gets buggy, I might note some one at 47.1652 MHz and smile at the precision of that reading, and yet it is off by 40 MHz (an errant 4 is showing). Lots of precision, lots of error.

However, as your question lies dormant:
> I wonder how this accuracy could be maintained,
>especially if some real power levels are involved heating the
>attenuator.

which is a concern shared by any metrologist. The load is the defining point of a power measurement. The load must be known and with power applied - it changes.

The first, and simplest, solution is to over engineer the load's ability to "DISSIPATE" energy. (sorry to scream in your ear, but others here needed to hear that) That would suggest using a 100W continuous service Dummy Load to measure 10W period limited power measurements. Or simply measure the load under the power applied.

Attenuators, on the other hand, are not 100W and few are 10W devices. Most are on the order of 0.1-5W. So, I presume you wonder how to get one of these into the signal path of a 100W rig? You use a directional coupler to tap a portion of the power (and you need to know the portion, but accurate determinations are fairly simple) and feed that tap through the attenuator and add the coupling loss (or that portion) to make a total.

In short, you have a 100W Source, a 100W Load, a 20 dB Directional coupler, a variable attenuator, an attenuator Load (how many miss this one?) and a detector. You can now read applied power at a 1W level instead of the 100W level. And you can measure the variation from that level with reference to your 100W reading to the resolution of the detector. Resolution or precision could run quite high. A measurements of change would also find high "relative" accuracy.

Relative accuracy means you do not need to know where you are, or where you started in absolute terms, merely how far apart they are. There is an interesting implication here in this subject. As we are interested in attenuation, any measurement of an attenuator is both "relatively" and "absolutely" accurate. This is one of Gary Peach's link pins to the absolute measure of received power.

I have acquired some ISA serial port cards that can be set for Com 1 to Com 8. These have jumpers on the cards to physically set the port and IRQ. These are new in the box with manual and driver disk. Some have one port - some have two ports. I'd like to sell off what I'm not using in my own machines. Reply direct if interested.

No, it's because the foreign QSL cards now cost so much. In order to get a QSL card from Germany, I've got to put 80 cents worth of postage on the envelope and 2 dollars inside. $2.80 for one QSL card. Yeah, I know a radio costs a thousand bucks, blah blah blah. Still, 2-3 dollars for each QSL card that I want from a DX station gets expensive. And these days, 90% of these guys have email!

I have an old ZEOS Notebook 386 that developed dead batteries when I did
not keep them on trickle charge.  I carefully cut one of the 2 open and
found that the batteries were standard 1700 mah cells that can be be
obtained from various nicad sources and soldered together.  I can
sometimes restore the batteries if not hard shorted by zapping them, but
zapped batteries never perform well after zapping, and must be kept on
constant trickle charge as you can see from my webpage at
http://www.ultimatecharger.com

And it takes too damn long and Germany is an easy one to work. The hard ones WANT DEMAND more. The whole thing is a racket. EQsl Must and soon WILL exist. If ARRL does not do it soon some will and start independent awards that will destroy the ARRL monopoly. Yes the Dxers will have to find another way to make money, BUT , they will save a LOT by not printing cards.

Naw, just wait 3 months, and you'll get 15 cards from Germany in
your "Buro" envelope, 34cents for the whole stack. You're just too
eager to spend money.

Hello all, I am still wondering is anybody has this model, should be in near
min shape 9/10 at least on the 10 scale. You make the offer on your terms.
Please e-mail me if you have one, will pay through paypal to make transaction
quicker. mikemost@aol.com.

73's,
Mike

A lot of those rare dx-peditions might not wanna use a freebie
service because some of the excess 'green stamp' proceeds aid in
defraying the cost of the expedition.

Yes, that is true and the MAIN reason it does not exist.

I have available a Kantronics KAM TNC to sell.  It's in perfect shape and
includes all manuals, cables, etc.  Only thing you supply is a "wall wart"
power supply.  73's, Nathan KA3MTT

It is an antenna of course!

"enlarging" it will move it to a lower frequency.

For example, your 10/15/20 tribander could be "enlarged"
to operate on 20/30/40.

I am selling a WJ HF 1000 HF receiver.

The receiver is in good condition and complete of suboctave preselector =
and operating manual.

Since i live in Rome (Italy) interested buyers are requested to pay this =
item upon delivery directly to a major express mail service (DHL,TNT =
FedEx or other) together with shipping charges.

Price is about 2500 US $

If interested contact me via email for further details.

Stefano

That's not the point. What if the German station is the QSL manager for
RW2F, or MD/DL5AXX or 3V8BB?

Need help getting started with packet using a 386sx laptop, KPC3 tnc, and ht
radio for portable packet station to take on my boat this summer.   Have the
packet working on a new computer just fine, but need to know how to run the
laptop with the program.   It appears that there is nothing on the hard drive
at all, so it does not boot correctly. Dont' know older computers very well,
but I know that I will have to run it with a DOS program only.   Need info to
get things started.   Any help appreciated.

First start asking in a group related to your laptop, DOS or Windows how
you get the thing working again.  Only when it is a usable computer, start
looking at installing whatever programs, including a packet program.

Rob

Is there any documentation available or any suggestions on how to get started writing Windows software using the soundcard to implement various modes such as RTTY, SSTV, PSK31, MFSK16, etc? My programming language of choice id Borland Delphi.

73,
Mark

With the increase in speed of computers, is it possible to implement Packet, or TOR modes using just a computer / soundcard and suitable RS232 / TTL PTT interface (i.e. no TNC / multimode controller)? I currently have a 533 MHz Celeron based computer available.

73,
Mark

Look here for the digital modes softwear for the sound cards.

http://www.muenster.de/%7Ewelp/sb.htm

I have ran several of the programs on a computer with the sound and
vidio on the motherboard and only a 200 mhz processor.

Hi Mark,

There are a number of great packet programs for a sound card available. Try FLEXNET or AGW packet engine for VHF/UHF packet. Try MixW32 for HF packet. All run under Windows.

You can also easily run the TOR modes using a sound card but DO NOT expect to do it using Windows!! Windows is a TERRIBLE OS for use with programs that implement "timing sensitive" modes like PACTOR and AMTOR. I do NOT think that a fast PC will make much difference. It is a OS problem not a speed problem. All the interrupts in Windows mess up the timing!

ALL the sound card programs for the TOR modes use DOS. The best sound card program for PACTOR 1 is RITTY version 2.38 by K6STI. I believe Brian K6STI still sells licences to this version of RITTY that supports not only RTTY but also Pactor 1.

Tom Sailor HB9JNX has developed a sound card program for PACTOR and AMTOR (running under DOS). But you need a SPECIAL sound card with a PersonalSoundArchitecture (PSA) Chipset . I do not think you can even buy such sound cards anymore. See http://www.ife.ee.ethz.ch/~sailer/ham/ham.html.

If you have an OLD style RTTY modem such as a CP-1, you can run PACTOR and AMTOR using Tom Sailor's TERMAN93 FREEWARE program. TERMAN93 is a VERY inexpensive way to get on Pactor 1.

Rob

Hi,

Is there something like a ping command for VHF packet? I want to be able to find out what other stations are on a given freq by sending out some kind of general ping and have the other stations answer automatically.

At one time I knew how to do that, but alas!

Thanks,

Bob

Haveing problems getting Kantronics tnc's to work with a diode matrix that
has been working with MFJ tnc's. Does anyone have a solution to this
problem or had the same difficulty. Maybe even a schematic for a matrix or
a source for a comercially made one. Scott, KA7FVV

That's it! Thanks! I've been looking at those on a
Taiwan web site where they're made, but there was no
U.S. dealers listed, and Google gave me tons of DSS
hacks rather than receiver modules...

Appreciate it,
Steve

Hello,

I like to cover a 400 - 500 meter space between to buildings without
wire. What hardware can I use (homeuser with not so much money)

Thanks,

Alexander Newald

he hasn't linked this page to his main ham radio page yet so it is a
little bit hard to find. Tom is now working with a user space model
for soundcard based packet. It looks pretty interesting and might
even be able to work for timing sensitive mode such as pactor and
amtor.

Anyone know why the wonderful IZ8BLY "Stream" sofware is constantly accessing the disk? This causes a bit of a problem on a laptop running on battery power. I could find no options in the software relating to this. I have my laptop set to turn off the drive after 1 minute to conserve battery and with Digipan and HamScope it is able to spin down once the program is loaded.

You must be running some type of TCP/IP software to ping. However I don't think there is "ping all stations" command. You have to ping a known address. I am going by memory so I could be wrong here. The last time I used NOS/JNOS ect in DOS mode was about 1991. I've seen some software that will show the packet network graphically in your area. I have a program like that for my Macintosh computer that is called "Packet Tracker ver 1.05" written by KB2ICI. I first ran this program on my Mac Classic II. I also run it on my Powerbook 180 and on my PowerPC. There may be some similar programs for DOS/WIN9X that can do the same thing. Good luck....

In a properly defined IP subnet, there should be an IP number reserved for the broadcast function (usually ending with as many 1 bits as "32 less the subnet's mask, expressed as an integer"). However, one often has to manually add an ARP entry for that IP broadcast number so that the callsign field at the AX.25 protocol level is properly set (usually either "QST" or "QST-3").

For a Net/ROM environment, a node broadcast might initiate a node broadcast response if the remote node is set to do that upon hearing a previously unknown node. However, I don't know of any that do that by default.

The AX.25 specification itself does not have a broadcast ping function. The best that one can do is try to connect to every station heard, and manually scan their "heard lists" for other stations one doesn't know about; then try to connect to them, etc....

My area doesn't have ROSE, Flexnet, or any of these other, exotic protocols.

The TAPR TNC2 1.1.8 firmware introduced a special function for it:

QRA or help for My path's fallen, and it can't get up

QRA ("Who are you") pinging is supported in release 1.1.8. A QRA ping polls all of the TNCs within range. Each TNC hearing the QRA ping will transmit its identification packet within 1 to 16. This technique provides the names of all reachable TNCs and digipeaters to the new, roving, and emergency-use packeteer. Also see "ANSWRQRA" command.

Note that the QRA function will not work if there are any digipeaters in the UNPROTO path. This somewhat, but not completely, helps limit a malevolent user's ability to seriously harm the network.

Sending QRA ping:

1) Set the unprotocol callsign to QRA

```
     cmd: UNPROTO  QRA<cr>
```

2) Manually send an unconnected packet

```
     cmd: CONVERSE<cr>
     <cr>
     ^C
     cmd:
```

3) In 1-16 seconds, if MONITOR is ON you should be receiving packets empty identification packets from other connectable and compatible TNCs.

```
     WB9FLW>ID:
     AD7I>ID:
     W5DID>ID:
```

NEW COMMANDS

ANSWRQRA ON|OFF   Default: ON

Setting ANSWRQRA to OFF disables the TNC's ping-response function. When the parameter is set ON, the TNC responds to non-digipeated UI frames addressed to QRA, within 1 to 16 seconds, with an empty ID packet. TNC-2 ignores QRA packets when ANSWRQRA is off.

Of course, by the time 1.1.8 appeared there were already many TNCs sold and
floating around without hope for an update, many branches of the software
and independent software developments were done, etc.
So I would guess that only a very small fraction of worldwide AX.25
stations is running software that would support the above function.

Rob

I would like to find a schematic for an NCR 12 volt 15 amp power supply. This is an actual 12 volt supply, and not a butchered-up 5 volt series. The model number on the panel is "315-0502654 F." Any help would be greatly appreciated.

I have no idea and did not notice it when I used it. I'll look for it and see if it does it on my system. By the way, you may want to try Hamscope (if you haven't already) as I find that to be a much more robust and friendly program, especially when tuning in the signal.

Regards,

Duffy - WB8NUT

If you have not tried Feld-Hell yet, it is a great mode. A lot of activity last night on 3.575. Made numerous QSO's. Many are working very low power with great print. Listen to two guys using 2 watts each, one in Tennessee and the other in Illinois. Both had average antennas. Hope to see some of you there.

Regards,

Duffy - WB8NUT

I have installed an additional sound card in a minimal Win98se computer.

I have read on the newsgroups that it can be difficult to get two sound cards running simultaneously, so approached this with a bit of fear. But the sound card was inexpensive, so not much to lose if it didn't work.

It works! After some initially confusing results, all seems to work now. I am running two independent copies of MMTTY on the (150PR Cyrix 6x86) machine right now, using different demodulator parameters, from the two independent soundcards, and each copy is getting its input audio stream from the proper input line jack. I don't see any performance degradation of any kind yet, with one copy running FIR and the other IIR, both with "normal" parameters.

The new sound card was a $20 (regular price) cheapie from CompUSA with ALS-4000 guts. The install was the automatic PnP install under Win98se, and followed an automatic install of the original (also a cheapie, but different) card. All interrupts were already in use on this machine, so some are being shared now. I may have to change interrupts manually later if conflicts arise in use.

I set the volume on each card independently - calling up the "master volume" panel allows me to select which card to adjust. This is a little cumbersome, but is not needed often.

One copy of MMTTY is using sound device 0, the other is using 1.

Oh - by the way - yes, I really DO need to run two copies of MMTTY simultaneously, and Mako did not provide for using the left and right channels independently for this...

DOVETRON regenerative RTTY Terminal Unit, model MPC-1000R-II. Top of the line commercial TU from mid-'80's. In addition to conventional loop output, it has EIA +/-12V and MIL +/-6V signal outputs.

Includes copy of manual for MPC-1000CR/T Mark II ("Tempest" version, which is a VERY similar unit).

19 inch rack mount, about 4 inches high. Front and back clean but some knobs are missing the metal disc insert. Top and bottom are scratched.

$175 plus UPS from ZIP 29860. Satisfaction guaranteed 10 days or money back less shipping.

Makes a neat tunable front end for the PK-232, which is how I am using my other one (have 2 of them).

When I was young and did not have much money, I had good results with a
flashlight and CW key.  Could exchange messages with an amateur in another
house about 50 meter away, but I would think it works over 400-500 meter as
well.

Very low power AM radios will work fine.

So will FM radios.

You can buy the low power transmitters at various hobby
supply companies.

500 meters is perhaps a bit long for them, but it should be possible.

Use morse code to transmit your messages.

But since this is rec.radio.amateur ... here is a "real" answer.

1. What do you wish to transmit? Audio? Video? Digital network?
2. What data rate do you require?
3. What is the content of the transmissions?
4. How much money is "not so much money"?
    (Some would consider $2000 "not so much money" e.g.)
5. Do you know how to operate a soldering iron?

Not that long ago, someone that calls themself "helpfull@my-deja.com" was
apparently pretty excited about using low cost NBFM FRS HTs to implement
a free wireless Internet system.  I don't know if Deja mail is working
since the sell-out to Google, but you might try writing this person
for help.  It would help if you revealed just a little more of your
requirements.

Good thing it didn't cost you more than that to ask.

In his country this means: go to Conrad (or order a catalog).  They have
all that is needed to setup such a link using narrowband low-power
transmitters requiring no license.

Greetings,

I believe in E-QSL, but nothing I have seen so fair fills the bill.

I think the solution should be open source so that we don't get locked in to one provider of trusted E-QSLs.

Here is the idea:

The system would use digital signatures based upon the RSA encryption standard. The public key would be signed by a trusted third party. Once the key has been signed, it can be transmitted with the E-QSL or looked up in a trusted public key server. The details is a little hard to explain, but the jest is once a amateur has a signed public key, anyone can validate their e-qsl information without using a active protocol with a third part. This means that my log program can email a qsl information almost in real time.

Everything needed to do this is public and free to use. We will need the following functions:

1. Certification Authority software and libraries.
2. Signing libraries.
3. validation libraires.

The goal is to create a set of libraries and software which will be licensed using LGPL (Lessier Gnu Public Licenses) or open software licenses. This will allow trusted groups such as ARRL to have a revenue on create certifications (signing public keys) but no one will have a lock on the software. This we allow logging software authors to incorporate digital signature functions into their logging program without having to pay a license fee.

I can do most of the design and some of the program, but I can't do it by myself. Most important I DO NOT want to OWN IT. For this to work it must be a free standard, with no strings attached.

TQSL to be:

1. A trusted system
2. Free and open standards
3. Easy to use and implement. ie: Users pushs a button on his/her logging program and a TQSL is created. This eqsl could be sent via email, to a e-buro, etc. The important

thing is once created it can be authenicated at any point
by anyone, just by point software at it.

Any takers?

Hi all:
The problem I have with E-QSL's is that their boring. There is nothing to display on wall. The ones I've received are not very well done and if I do print them they don't look very good and I have to pay for the cost of printing. They take up a lot of room on the hard drive if you don' print them. So I find little to like about E-QSL's. I saw that the ARRL was looking into a system that would, as I read it, keep a trusted list of stations you have worked, and conformations from those stations which would be good for awards. I guess that this would be OK, but not much fun. I can see no way that E-QSL's can ever be as much fun as getting a bunch of cards

in the mail. I went to the E-QSL site and I had a bunch of "cards" waiting

for me, I looked at them and down loaded them, but after a bit I dumped them

off the computer, no magic, no fun, no interest.

John
Why not upload those E-QSL 'Cards' to a free web page provider like QSL.net,
Angelfire or Geocities
and put them on a web page so not just you but EVERYONE could see them? It would
also save space on
your computer and wall for that matter! :^)

Is 802/11b valid there? You might look into conecting the with 2.4 Ghz
high-gain
directional antennae.

Your points are good. I agree that paper QSL are real cool. But E-QSL doesn't have to mean that you don't get paper. I could mean you get paper with a barcode digital signature on it or get paper in addition to a E-QSL. It would also mean that you won't have to send away those cool paper QSL cards and risk them being lost or paying the postage. It would also mean you would get your awards quicker because it could be validated by machines. It also means you wouldn't have to pay for sending someone that is chasing paper, but doesn't really care about the QSL card.

Also with E-QSL "cards" it opens up a lot of non-boring possiblity. Such on-the-fly E-QSL card cration. Maybe from a web cam or alike or instead of a JPEG it could be a MPEG file which has your QSO from the other stations view.

Keep also in mind that digital signatures could be applied to a log entry as well. This would mean that you log could have a signed QSO field and what is shipped to the ARRL would fit on a single floppy.

Happy DXing

-Darryl WA1GON

All true but the speed and the fact that qsling is TOO EXPENSIVE and TOO SLOW would make this ideal. NOBODY is saying you can't ALSO send a REAL !!! QSL.

I am sick and tired of waiting a year for a card and paying over a buck a card or maybe more when they want green stamps, oh yeahhh maybe that's it???

Hello,

so I see there can be answers. Sorry if my first question was not as good as it should be.

My problem is:

I have two buildings with internal networks using linux boxes as servers for mail and fileservice. Now I have to set up a solution to connect these two buildings (about 500m distance) so that email is possible. The problem is that there is a river (small, but water)

between them so wire gets no chance. I would be happy with about 50 -
100 kbit that should be enougth for email.

Thanks,

Alexander Newald

Now that would be the understatement of the year...

First you just tell us you want to travel 500m and have not much money, and only when you get the suggestion to walk or use a bike you tell us there is a river within that 500m and that you have requirements for the speed. But still you don't tell us how much money you have, what kind of skills you have to build the solution (e.g. knowledge, time) etc.

How can you ever expect a good answer to such vague a question?

Maybe we should just have said: type your question at http://www.google.com/

Then at least you can make your own judgement about suitability of the answers.

Rob

Minor detail, I suspect. The principles are the same; perhaps using whatever
CB-type radios are available in Germany.

Dana

Now let me get this straight Darryl....

We now need a system of "E-QSL's" because (really) hams are too stinking *cheap* to spend 34 cents postage to put their QSL in a envelope..??

This is the root cause (above) which is REALLY driving this issue! Is it no? Be honest now. What a bunch of tightwads you hams are. When's the last time GW saw sunlight opening up your moldy wallets? And I thought all these guys were tighter than a crab's asshole at hamfests - hoy.

I really think cost is a secondary factor. The main factor is that e-QSLs
are
easy and fast. I known hams who have waited over a year for a QSL card.
Cost is important as well. There is the cost of printing and the cost
of mailing. $0.34 isn't much until you have to mail out 30,000 cards, then
we are talking real money. Even someone like me who only makes
a few thousand contacts per year it still adds up.

The other issue is Trusted E-QSLs will help streamline the awards process.
Not only in the amount of time it takes to process the award, but in
the time required to collect the QSL cards.

I have been getting a lot of interest in email about this concept.

Later

Oy vey, what bullsnot! You are definitely on the right track concerning e-QSLs but all this damn bureaucratic rigamarole red tape nonsense over them is preposterous.

You work a guy and he sends a plain and simple e-mail conformation. "This is to acknowledge my SSB contact with WX56Fink on 14.279 at 0046 UTC, Feb.20,2001. Ur sig 5/7 and so forth and so on." You then print it out and if need be send it to the ARRL for your WAS or WAC or whatever. If they accept it,fine. If not, they're cutting off their nose to spite their face. Why my cavalier attitude?

One has to be just plain stupid not to know that computers are overwhelming ham radio in interest/popularity. The ARRL wants to do everything possible to keep their own tuchuses afloat so why would they reject such down to earth e-QSLs? You think they're out to make it tougher on Joe Ham? And besides, we are a cut above the rest, aren't we?

By nature, QSL collectors are Boy Scouts except of course if they nowadays lean toward homosexuality which is taboo. At any rate this whole concept of e-QSLs is excellent. The price of postage keeps rising and so do QSL cards. Naturally if the ARRL goes along with the idea, their QSL printer advertisers will go crazy and try to convince them of the fact that every e-one will be bogus. But in the long run they'll shut up because it's a losing battle for them.

"Wags" you're a flaming genius but enough with all this pomp and circumstance regarding the formalization and authenticity of those cards. Want to work the country of "Goochaboola." Nowadays one can either listen for it on the bands and send a signal at 186,000 miles per second to snag it or look for a newsgroup, alt.goochaboola.politics and work it that way. Want to keep ham radio alive? INCORPORATE computer QSLs into it instead of scoffing at the idea. How about an autograph, "Wags?" You're a mover and shaker.
Doc,AF2Y

Works for me. But depends on firmware version.

I use mine on HF so this goes first- VHF N^MHB 300^MWIDE N^M

He doesn't have to admit anything - he DOES knows things. It is
obvious that it is YOU that doesn't know anything(other than maybe
haven taken/are taking a 1st year Community College electronics
communications course).

> thats a good one. maybe you had a bad day, that is

You are still acting like a bull in a china shop.... or maybe a better
analogy is a 250W paging transmitter....

You see, what you fail to take into account in both your theory and
your posting behaviour is NOISE. Don't be suprised when people try to
turn up the squelch.

I checked your previous posts and I could not find any references of
using some full duplex constructions. The GIF file contained a 2/4
line hybrid and a PTT driver, strongly suggesting a simplex or half
duplex system.

>one question, is 100hz-8khz audio frequency band sufficient to the modem
>connection?

With a 40 .. 50 dB signal to noise ratio and unchanged propagation
path you could reach 14.4 or 28 kbit/s in a full duplex configuration,
but the real question is, which transceivers produce such SNR even
with an extremely strong signal. The VFO/synthesiser phase noise will
ultimately limit the SNR as will the noise from microphone amplifier
or audio amplifiers.

>i think it is more than sufficient, cause telephone lines have much worser
>characteristics than my trasnceivers will have.

Any modern telephone system is fully digitalised except for the last
few hundred meters or a few kilometers at most from the local
telephone exchange to the subscriber. Any deteriorating of the signal
will occur in these short lines. The bandwidth and signal to noise
ratio are well defined by the DAC and ADC in the telephone exchange
and the local loop wiring have much better performance than that.

>if i can make a connection to my internet provider at 36kbps,
>using my 56k modem, than i should succeed connecting two modems by radio
>link not less than in 36kbps. (14kbps, or slower would be enough to me, but not
some awful
>1200bps)

These modems have been designed to exactly match the format of the
digital telephone network. The "56 k" modem can at best transmit 56
kbit/s in one direction, provided that the transmitter (usually the
ISP) is connected directly to the digital telephone network (2B+D or
30B+D), thus, the only time the signal is in analog domain is between
the local telephone exchange and the subscriber. Apparently the modem
at the subscriber has a high resolution ADC so that it can better
guess which of the 256 levels was actually generated by the DAC at the
exchange. In the opposite direction (subscriber to ISP) the modem
generates voltage levels that are quantified (truncated) to one of the
possible 256 levels and transmitted to the ISP, thus reducing the
number of bits/symbol and hence, limiting the uplink to something
like 28 kbit/s.

This is still complicated by the A-law (or u-law in America) compression of the telephone audio signal. While the sample size is 8 bit, it is not a linear 8 bit code, but rather a compressed format (floating point format, with 4 bit mantissa, 3 bit exponent and a sign bit). If linear converters are used, the ADC/DACs have to be 12 bit wide, thus representing 72 dB SNR in the local loop (subscriber to local exchange) wiring.

Generating such S/N ratios is even hard for normal broadcast wide band FM receivers, requiring considerable amount of transmitter power, most likely 100 to 10000 times more than required to have a communication grade NBFM connection at the same distance.

The general principle is that if you are power limited, use a small number of bits/symbol (usually 1 .. 2) but if you are bandwidth limited, use as many bits/symbols as allowed by the signal to noise rate.

All modern phone line modems have been optimised for the limited bandwidth of the digital telephone network (as imposed by the 8 kHz sampling rate) with as many bits/symbol as possible. This is not the way to go with radio circuits, since adding one bit to each symbol requires increasing the signal to noise ratio by 6 dB or quadrupling the transmitter power.

I've encountered plenty of "microphonic" receivers and transmitters;
it doesn't surprise me a great deal to hear that a receiver benefits
from a vibration-damping chassis.

Hi, Gary -

QST has published *two* sets of plans, one each circa 1988 and 1997 or so.
The latter one was by an author named Stanton. The files for the
processor are at the ARRL Web site (www.arrl.org). You can probably find
it using Stanton as a search item.

I was planning on building one to get my Extra but jumped for an MFJ unit
instead. Worked, too!

Best regards -

Jim Horn, WB9SYN/6

I would recommend to first (unless you are in a hurry) look at some junk sales, hamfests etc because many serial cards appear there for very low prices.

I am using a 6-port ISA card from Boca, but I don't know if these even exist today.

Whatever you buy, always make sure you have the matching cables with it or the schematics for soldering your own cables.

>- The PCI cards "share" one IRQ. Is the ham radio software out there
>compatible with this (DOS/early windows)? Is this software driver
>application truly transparent?

I am using Linux so I really can't comment on that. All my six ports share a single interrupt, but Linux applications always use the driver interface so there is no problem with that.

Be careful and avoid any card that claims to be "intelligent", "has its own CPU", "reduces load on the main processor" or has very many ports.

These cards were designed for use in multi-user systems in the character mode terminal era, and need special drivers that usually are only available for server operating systems. When you have a suitable driver, they will cause problems with any application that tries to do tricks with the serial port (like bit-banging on the status lines, using the baudrate generator as a timing reference interrupt, etc).

But this is also more or less true for the USB serial devices.

>- I have heard the ISA cards are less self sufficient, and require more
>CPU time than the PCI cards. I like to keep several applications open at
>one time. Would an ISA adapter cause a processing slowdown?

Not one that you notice with your application. There may be a disadvantage when running ports at high speeds and with high volumes of data.

>- Is it important to keep as many IRQ addresses open and not waist them
>on an ISA card?

Depends on your use of the system.
In my system, all available IRQs are in use. But so are all the slots.

>- Several Sound Card programs out there use the RTS or DTS leads on a
>serial port to key the transmitter or activate the PTT. Do you need a
>dedicated a physical serial port to take advantage of this, or can you
>pull these leads off of a serial port that is connected to another radio
>peripheral (double up)?

I am doing that on several ports. But I don't know if there is a problem with this in Windows. There certainly isn't a problem in the hardware.
(one of my ports is used for 4 different applications)

Here is a version updated by DB2OS in 1993:
http://www.nordlink.org/eng/wa8host.txt

Hope this helps!

Thanks, but that is the host mode docs. It explains how to use host mode, but it doesn't list the WA8DED commands.

What I'm looking for is a later version of a document entitled "AX.25 Version 2 Multi-channel TNC FIRMWARE (version 1.0)", which contains a table like this:-

COMMAND	PARAMETER	DESCRIPTION
A (1)	0	Auto linefeed disabled
	1	Auto linefeed enabled
etc...		
W (16)	0-127	Repeater wait (10ms)

I have been using a Cyclades 8YS (8 serial ports capable of 115Kbps simultaneously via
2 embedded RISC processors) for many years.. They use a custom UART and are available
 in both ISA and PCI. They are supported by a large number of operating systems, including
all version of MS Windows and Linux. The url is http://www.cyclades.com

Running QRP PSK31 with Digipan 1.2 and noticed that, as well as the wanted trace of an incoming signal, I've got weaker traces of the same signal on the display. The stronger the wanted signal, the worse the effect. Using a Yaesu as the receiver. Have not tried an alternative rx as yet.

Any thoughts appreciated.

Have you thought of using a USB to serial port converter? If not take a look at http://www.bb-elec.com/add_a_port/serial_usb_chart.asp

Didn't ever have that problem. But we're up to version 1.6d now. Maybe an upgrade would help.

I have had good luck with the 4 port ISA cards from Dolphin.

> - The PCI cards "share" one IRQ. Is the ham radio software out there

The driver is not transparent.

Not true.

Depends on what else you plan to do with the machine.

> - Several Sound Card programs out there use the RTS or DTS leads on a
> serial port to key the transmitter or activate the PTT. Do you need a

No software supports this.

>
> I'd appreciate any feedback

It all depends on how many serial ports you need, and exactly
what software will access them. The DOS machine over to my
right has 11 serial ports ... but that's a special case.

I've seen this a few times myself.   The "ghost" will typically be at 3
times the audio frequency of the "main" signal.  This I attribute to the
transmitting station overdriving the input of their rig, flat-topping the
audio signal.  That would result in 3rd, 5th, 7th, etc. harmonics.

Reduce the input on your soundcard, what you see are harmonics.
Every digital converter shows you these birdies if the input to the
soundcard is too high. But the different programs like MMTTY or Digipan have
different sensivitit�es for this harmonics.

BTW its time to upgrade; a new versionis out since 3 days. Go to:
http://members.home.com/hteller/digipan/ and load your version 1.6d.
I think its time for it !

Greetings from Vienna

Hello all.

Just to say I have added PAL-PSK software to the files on my download page.
It is relatively new psk software from Erik VK7AAB. It has waterfall, and
scope display. Can be used with upto three channels, and has a logging
report utility built in. Developed using Visual Basic, with the PSK Core
taken from Moe AE4JY's excellent work.   Easy to set up, it is worth taking
a look at. This version was completed on Dec 18th 2000.

Have a play with it, and see what you think.

http://www.btinternet.com/~g3vfp/download.html

Regards,

Dave G3VFP.

INTRODUCTION

Hello again,

my name is Vladimir and my HAM callsign is YZ7REA. This is my second addressing to the general HAM population worldwide in regards to this project. For those of you that are familiar with the project goal I can say that I'm not gonna bore you too much. But on the other hand I'll give a "short" brief about this project for those that don't know whatta heck I'm talking about.

"TM-V7 WIRELESS REMOTE"... Sounds interesting? Well it sure is! And it's simple too! For all of you that are familiar with this KENWOOD mobile radio and own/would like to own one, this project will open a whole new view. The goal of this project is to separate the detachable front panel from the radio and establish the digital communication between them at distances of several miles or even more. Why? For many reasons. If you live in a heavily populated area and have problems with TVI, live in an area where the density of HAMs is big or you just wanna be "on a top of a hill" and be able to make contacts at larger distances without using a lot of power or spending a lot of money on directional antennas, rotators and tracking/positioning systems this project will give you all that you need.

DISCLAIMER

Before I go further with explaining how the system will work I have to say that this project will NOT be in compliance with laws in some states or countries. Respect that as you respect the HAM code that prevents you from transmitting outside the boundaries of amateur bands. First of all let me tell you that I won't be selling this system to anyone nor will I sell schematic diagrams or any PCB's etc. This is my idea and I want to share it with HAMs worldwide. So, what you choose to do with it is your own business. All I ask of you is that you mention my name and callsign if and when you post any info about this project on/in discussion forums, publications magazines etc. Second, if any of you should choose to use my idea for commercial purposes I ask that you write me an e-mail notifying me about that. Third and the last, I'm not going to responsible if any of you choose to use this system even if it means breaking the law in their country/state.

TECHNICAL STUFF

I'm working on the system whenever I have spare time on my hands (and that ain't often). So, I'll keep you informed as the project develops.

1. General info

According to the KENWOOD TM-V7 service manual the four pins that you can see when you remove the front panel (LCD/control unit) are:

```
-----
[ o ] pin 4 - 9.6V
[ o ] pin 3 - GND
[ o ] pin 2 - Data out
[ o ] pin 1 - Data in
-----
```

After measurement with an oscilloscope and volt meter I found this data to be TRUE. What you should know is that data communication is asynchronous with speed of 3125 bps (3K2). The control unit checks to see if the panel is connected to the radio every 0.5 seconds and if it misses two counts it assumes the panel is taken off and shuts off the radio. So, this means that you need a FULL-DUPLEX link to be able to connect these two together. The easiest (I'm not saying the best) way is to use pair of full-duplex radios on 900MHz, 23cm, 13cm or any other band that has a "amateur digital communications" slice of the spectrum in it. Of course you have to be sure to use the band that is legal for this stuff e.g.: packet radio link freq. I'm using a 3cm ATV FM transmitter with 5 sub carriers on each side and no video "carrier". You can use any carrier from 5-8.28 MHz. You'll need to relay the following signals from the CONTROL PANEL to the radio:

1. PTT, UP and DOWN button control*
2. MICROPHONE
3. PANEL DATA OUT (3125 bps)
4. DATA TERMINAL TX
   (connection from PC, packet modem, SB etc. max. 9K6)
5. AUX (used for remote switching of PA's etc.)

You'll need to receive the following signals from the radio:

1. VHF RX AUDIO
2. UHF RX AUDIO
3. PANEL DATA IN (3125 bps)
4. DATA TERMINAL RX
   (connection to PC, packet modem, SB etc. max. 9K6)
5. AUX (used for remote switching indication etc.)

* Three button control via a single wire/carrier can be achieved by using the 3 different tones. Something like CTCSS, but they can be any frequency even hearable from couple of hundred Hz up to couple of KHz. By using a PLL DETECTOR on the other side you can precisely determine which button/key has been pressed.

2. Transmitter(s)

You can use many solutions from cross-band (example 23/13cm) to in-band full-duplex radios. I leave this to you to decide. As I said I will be using 3cm amateur microwave radios, both for PANEL and RADIO side of the link. Small antennas, little power, huge gain, simplicity of construction, great directivity and the most important thing good frequency separation in free space at antennas just couple of feet apart are why I decided to use this band for my project. As little as 10mW and a 36" dish will cover the distance of more than 15 miles if line-of-site is present.

3. Receiver(s)

Commercial LNB's, SAT dishes and SAT receivers with small mods can be used.

4. MODULATORS/DEMODULATORS

This really depends on the type of radio that you're planning to use, but bear this in mind. All the signals you need to relay are in fact NBFM signals. This means that you DON'T have to use WBFM sound carriers like I did. There are certainly much better solutions than mine but this one, as I said before, was the easiest one for me since I already had some equipment that I wasn't using.

5. COSTS

This is also very relative, but if you use some old uW equipment for 3cm like I did it comes very cheap to have such a system. All taken in consideration the total cost for this system shouldn't exceed $150.

5. LIMITATIONS

Laws that prohibit this type of data transfer, line-of-site is a must, very bad weather like heavy rain, snow thick fog etc. can downgrade the system reliability. More than one TM-V7 WIRELESS REMOTE system at the same frequency in each other signal path can probably interfere with each other (I haven't tried this). And probably more...

6. BENEFITS

Just think about it for a sec!

Well I'll rap it up for now. Feel free to ask any questions regarding the system, but please don't ask for any schematics 'couse I still haven't drawn them yet. They're all in my head for now. I'll probably put more info on my web page later on once my system is up and running and monitored for some time.

****

I'd like to thank KENWOOD for "helping" me with this project and directing me to the nearest KENWOOD dealer to spend $40 for the Service Manual. Also thanks to KENWOOD technical support who told me that if they gave me the DFK-3C for this project they'd go bankrupt. :) I know that they get all kinds of weird requests every day, but I also know that every Tom, Dick and Harry don't make something like this and share it with fellow HAMs all around the globe.

****

As for me... No medals please! :) I'm proud to be a HAM!

Your HAM friend from YU-land
YZ7REA Vladimir

Dave: Sri to inform you, but Mini-dish OR even BUD (Big Ugly Dish)
will save your marriage should you get hooked on 6m. Give it a
consideration. I'm sure your family would eventually pay little
attention to Ch 2-5 off your multiband TV yagi. 6m FM is not
so bad as ssb (FM by nature dosn't have the PEP voltages even
10W ssb has). 6m will never attract the grocery list comms of
2m because of the technical/TVI challenges, but there is a great
bunch of hams on the magic band minus the cw egos. Passive filters
don' twork
because of analog TV's wideband recievers. Granted a good
ground, topnotch coax with short runs and a quality radio will
minimize TVI within you're nieghborhood and home. But forget
chs 2-4 over air ..especially with a broadband amp
  Work at it...the openings are worth it.

tis true. after I got on to psk, a friend, K2NJ, watched my output and

helped me tone it down...turns out optimum, on the 756pro, is about
1/4 of the full mic gain. your mileage may vary....

Hi guys.

Just to say that JE3HHT Mako's latest RTTY software release of MMTTY Ver
1.61E is now available for download from my U.K site.

http://www.btinternet.com/~g3vfp

Best Regards,

Dave G3VFP.

6 meter FM is as bad on TVI, because it's a constant carrier and wider
bandwidth...
I have found in my many years of avid 6 mtr fun, that lower power on
SSB (10 watts) is possible and tvi is almost unnoticible but the use
of the same power on 525 FM wipes out the tv's.

If there is a six meter opening, 5 watts can work a nation!

>Dave: Sri to inform you, but Mini-dish OR even BUD (Big Ugly Dish)

Don't forget, IMD is caused by non-linearity *anywhere* in the signal chain including your own receiver and sound card. If you find that *everyone* has distortion or *all strong stations* have distortion you might want to investigate your receiver. On some receivers fast AGC can cause IMD number to be poor on signals S5 or above.

Don't you just love the name?  Anyway, just finished playing with
Hellschreiber last night and had one QSO.  This is a very interesting mode.
Antique, yet new.  Anybody wanna try it?  Look for me on 14.063.

Bud,

Pacterm '98 will work fine on your Laptop. It's true 32 bit and runs with Windows 95/98/Me as well as Wiwndows NT/2000.

Download the demo from http://www.cssincorp.com/pacterm

Hello all.

I was wondering if operating PSK-31 on my old FT-101 would be possible. The manual prides itself on having only fifteen transistors. Is this vintage radio too old to be running packet on?

Thanks!

```

I know the 101 was a good radio in it's time for use with a TNC and packet, as well as RTTY. I am not sure however if it will be easy to use with the new "soundcard" modes. I am sure an interface will be needed to avoid any high voltage problems getting into the computer. I have not done much with the new modes, but something like the "Rigblaster" may be the answer.

Hope someone can be of more help.

Ian,

I have worked stations on PSK-31 using FT-101E series radios. They drift, compared to more modern radios, but you can get away with it because everyone uses AFSK and AFC. On the other hand, it is easy to lose copy of someone who is drifting, and to take a few seconds to get it back. I would say that you should go ahead and do it, but think about a more modern radio if you are going to use this very narrow bandwidth mode.

I saw the note about voltages getting into the computer. I do not know if there is a rear constant-voltage output on the FT-101, but I doubt it. You can steal the audio out of the rig from the headset jack, and that should not be too much for the computer to handle. That takes care of receive.

On transmit, I don't think that there is a high voltage on the mic input, but check. The interface that is shown in the Zakanaka and MMTTY Help files, consisting of a 1:1 transformer followed by a voltage divider, then into the mic input, will keep microphone voltage out of the sound board. It will cost you under $10 if you purchase all parts brand new at Radio Shack, box included. I bought the parts two weeks ago for $7.30 plus tax, and gave the finished interface to a friend today. It took 30 minutes to put together, including the time to drill holes for the phono jacks. This is the interface that I use with my Ten-Tec Omni VI. You can also check out Rigblaster and Buck Rogers' sites, along with other suppliers. The urls for these are in the same Help files. The interface will be the same for a new radio, if you decide to replace the FT-101.

T/R switching is a separate issue. If you have vox, you can avoid any more wires and use that. If not, there are designs in the Help files for transistor and optoisolator interfaces to protect the COM port you use for T/R control, and the Buck Rogers url has a bunch of designs you can build, or get from Buck. I think this T/R interface is also part of the Rigblaster device.

Thanks for the input and advise. It is nice to know that I can get away from having to purchase a new rig to operate this mode. Would you suggest purchasing a frequency counter to monitor and correct drift or is there another way to prevent it from happening?
Also, what, in your opinion, would be a good modern HF radio for working digital modes?

BTW It has been about six years since I have operated on the HF or any HAM band due to being in the military stationed overseas where I was not authorized to operate or setup a station. Being out of the loop for so long, I recently found out that my Tech Plus license is no longer valid anymore!? This is back when vanity callsigns were a dream and the no-code tech was not no-code. No worries, though; I am scheduled to test out next month.
All I ever used to use on HF was CW and from what I gather, CW is losing popularity with many amateurs now. Oh, well. On to better things and this psk31 mode has intrigued me.

Thanks again for the advice.

73,
Ian KB5TBA

Ian,

One minor addition to the good suggestions. Make certain you follow
the AM power limitations. PSK is a constant duty mode, and those
sweep tubes are getting hard to find. Good luck!

Alan

Alan,

I appreciate the heads up (- again, what a great group! -).

I bought this rig at a '92 Dallas hamfest as-is for $50. It was in good visible condition but the owner said that he knew nothing about its operation. So, I paid him the $50 and took it off of his hands. Upon setting it up and plugging it in, I noticed that several of the tubes were not heating up. I could not even hear anything over the speaker. Discouraged about not being able to QSO on my first "new" rig and being out $50, I went for a walk in the woods.

About a mile and a half out, I walked to a creek where I found a trash heap that washed in. I noticed that there, in the trash heap, was an old antique tube type television. I quickly removed the "wing nuts", pulled off the back cover, and removed all of the tubes out of the old set that I could carry. Surprisingly, three of the tubes out of the old set were identical replacements: 12BY7A, 3EJ6C, and another that I cannot recall. What luck!

My first HF QSO was on what I thought was the 10M band voice. "CQ CQ CQ from KB5TBA!", and a quick reply, "KB5TBA this is Travis. How copy?" During the QSO I asked "Travis" what his call sign was and he said that he was not a ham but a CB'er. I know my VFO and band was set on 10M. I asked him what frequency that we were on and he gave me a freq that was about 3MHz lower than my VFO indicated. He said, "We are between the 10 and 12 meter bands - a kind of dead space. Don't worry, everybody does it!" Panicking I replied, "I gotta go!" and shut off my radio. HIHI

Upening up the radio and checking the xtals, I noticed that they were replaced to operate CB! So, I stuck on 40M CW from then on. I eventually changed the crystals but I never again switched my dial over to 10M since.

Yeah, I know about how hard it is to get tubes for these things. I was lucky, in my case. I have a feeling that the finals are going which are a pair 6JS6C's (I think). A couple years ago I checked on a spares. They had a price tag of $69 each!

I would like to operate some of the digital modes on a TS-450S while at the same time having the computer in control of the rig. YPLog appears to support this, but I'm having trouble with the I/F.

I built up the soundcard I/F using isolation transformers and an opto-isolator to connect the rig and the computer through the 13-pin DIN connector and the serial port. The I/F works as advertised.

I also bought the W1GEE I/F to control the rig from the computer, and it also works as advertised.

The problem is that I want to use both of them at the same time.

The PSK-31 I/F wants to use RTS or DTR to key the transmitter, but the W1GEE uses both of these signals when talking to the rig. Also, the PSK-31 I/F takes great care to isolate the rig ground from the computer ground. The W1GEE I/F ties the two grounds together.

Has anyone done this on a TS-450S successfully?

Thanks,
Ed - N5KZW

No. I am talking about drift of a few Hz. at a time. Don't touch the dial
during the QSO, PSK31 is too demanding. Let the other guy's AFC do the job.
You will not be able to make the corrections. You should probably warm up the
rig for 30 minutes before going on PSK31, but, of course, you can make CW qsos
during that time, hi.

>
> Also, what, in your opinion, would be a good modern HF radio for working
> digital modes?

I won't make a recommendation, but almost anything completely solid state will
probably do. I would just about guarantee any ham radio made in the last 10
years as OK, as long as the actual radio that you get does not drift more than
the specs say.

I've been doing some web searches for DSS receiver modules.
Does anyone know of a source for a cheap ($20 - $30) source
for these. I'm interested, because they are operate with a 1 GHz
input. This is for an application other than MPEG video. As I
understand it, the dish downconverts the satellite signal to 1 GHz
IF, which the receiver that hooks up to that, is just what I would like.

Even a source for a cheap DSS receiver (that won't be used as one) :-)

Steve

CSS revives Log Windows from defeat and sees increase in TNC software sales.

Muscle Shoals, Alabama. February 14, 2001: Creative Services Software announced that FY 2000 sales of the Log Windows logging program exceeded the number of units sold by AEA in 1994 and equaled the number of units sold by AEA in 1995.

"This proves that there is still a market, abet a smaller one than other markets, for Ham Radio Software.", said Rick Ruhl, W4PC, President of Creative Services Software. "Many consider 1995 the year the Internet had a big influence on Amateur radio, and I think our 2000 sales show that many who went to the Internet have join the ranks of the Log Windows owners, due to our Internet enabling of the program."

CSS also reported that sales of its TNC products, Pacterm '98 and PkTerm '99 Preview 1.5, have seen increases since the addition of the PSK-31 mode. This enhancement allows use of the TNC to key the radio in PSK-31 mode, saving the ham a serial port, and having to change between programs to change the different modes.

The Log Windows product retails for $69.95 and upgrades from release 3.06.15 or earlier is $40.00.
Those who have purchased version 3.06.50 or greater will get this upgrade free. Pacterm '98 and PKTerm '99 retail for $79.95 and all products include free in-version up grades. They are available from dealers around the world, as well as direct from CSS.

Log Windows is owned by SCO, Inc and is maintained by Creative Services Software.

Creative Services Software is at   http://www.cssincorp.com
The Log Windows homepage is at   http://www.logwindows.com

Windows, Windows 95, Windows 98 , Windows NT and Windows 2000 are Registered Trademarks of Microsoft Corporation.

If you do not use the rigblaster and start the programs can you hear
sound out of speakers pluged into the sound card ? If so then the
transmitt part of the program should be working. To get the receive
part working just plug the audio from the rig into the aux input of the
sound card. Then see if you can tell if any sound is doing anything on
the screen. YOu may not get any print on the scteen but should see
something on the display.

YOu may have to go to the sound mixer program and enable the inputs and
outputs of the sound card. Right click on the speaker in the task bar
and see that the correct inputs and outputs are enabled and the volume
slider is near the top.

I doubt it is the sound card not being a sound blaster if you have tried

several programs. I have not used a soundblaster but have used several
other cards on computers from a 486/100 to a computer with the sound
card built on the motherboard. Even running a psk31 program on the
sound card and decoding some digital pagers off a scanner with a hamcomm
interface on the parallel port the all in one motherboard would do that
with an AMD 200 mhz processor. You may have to go to the autoexec.bat
program and add aline something like   setblaster=220h .. Don't
remember the exect line and the 'ham computer' is in another room so I
can't check that out.

Oddly enough, my "sound card" is part of the mother board and is not a
soundblaster, however, to my good fortune it works fine, but two close
friends were not so luckily.

If you don't have Digipan, go here and download this program mostly for psk31.

http://www.muenster.de/%7Ewelp/sb.htm

It is a free program nad works very well.   Set it up for psk31. At the bottom of the display will be an area that will probalbby be blue with some lines comming down from the top of the area when you have a signal tuned in.
Set your receiver to 14.070 in the usb position. You should then start seeing some vertical lines when you hear the psk31 tone. Take your mouse cursor and put it over one of the lines and click on the line. Yu should then see some print on the screen.

As for the computer not haveing an autoexec.bat or config.sys file you normally don't need them. I use the autoexec.bat file for several reasons in my computer, but the config.sys is normallly never needed in win 98.

You did not mention if you ever used the other modes, but if not then it may be that you just don't have the rtty tuned in correctly. For ham transmissions you normally set the receiver to lsb and the mark tone will be the lower tone and the space tone will be 170 hz higher. If you think it is tuned in correctly, the program may be set up in reverse. Try the other sideband or tell the program you are using the reverse mode.

autoexex.bat and config.sys are only for DOS mode compatability. Your
Windoze system will run fine without them. I have several Windows
computers running just fine without them.
HOWEVER...if some of the programs run in DOS mode, then you'll need to
put your sound card params in config.sys, and the names/path of any
required DOS drivers in autoexec.bat.
HTH, Jim

Now I understand what you are after, sure you might be able to connect
two phone line modems with two transceivers. You need two transceivers

at your site and two at the other site :-).

One of your transceivers is constantly in transmit mode on one
frequency band and the other is constantly on receive on a separate
frequency band. On the opposite site, the frequencies are reversed.

Any modern (>= 9600 bit/s) phone line modem needs a full duplex
connection so that it can tune the equaliser with the training
sequence when the connection is established.

To get a full duplex connection using radio, you need two separate
frequencies.

Having a clue about digital communications is a good place
to start.

Telephone modems are designed for a high SNR channel whose
characteristics are relatively constant. They run through
a training sequence at the time of the initial connection
and use the results from then on. Additionally, they operate
over a full-duplex connection.
```

Amateur communications are generally half-duplex, with a relatively low SNR. If you could come up with a very high SNR, full-time full-duplex communications and fixed channel characteristics, you just might be able to make it work.

Personally, I wouldn't bother. There are better ways of solving the problem.

From a purely personal point of view, I dislike VOX for digital work.

Using a com port with a real PPT just feels more solid to me. As long
as your speakers can reproduce the tones, you shouldn't have a problem.
My gut says to check the audio in-outs to make sure they are in the
right places.

Have noticed sound level difference with different programs. Check your
sound settings. The Mic Level input, if used, may need the Mike Boost
20db box checked in the advanced box.

> rig by the by is an ic756pro. computer is 200 mhz pentium with win 98.

I have used True TTY, MTTY, WinPSK, Digipan, ChromaPix, Stream, and many
other programs all without difficulty with the RigBlaster and the
IC-756pro combination. Use the monitor switch to listen to the actual
input. It helps to speed things up sometimes when testing.

Good luck.
73,
Pete

If you are so sure that you can do something, and don't want to accept any
advise that it is not so easy, then why do you bother asking on a newsgroup
and commenting on the content???

Just go and do it, and leave us poor bastards alone.

Rob

Well, you little sonofagun!! IT WORKS!!! at least im RECEIVING Psk31...havent got TX to work yet, but pbly try that with PTT rather than vox....in fact, the station i'm copying now, KC5UN is using a rigblaster interface....

now all i gotta do is get tx working...vox seems to trip the vox all the time...

THANKS!!!

Now that you have this program working, there are several more at the same site that I have had good luck with. For just RTTY, there is a program called MMTY that works almost as well on receive as the old ST-6 hardwear demodulator I built many years ago.
I don't recall the name of the program, maybe something like hamscope ?? that has multimodes in it.
MOst of the time it is just a mater of learning how to tune in the signals and what they sound like. You should try to keep the tone of the signal in the range of 1000 to 2000 hz in most cases. Much lower

and the harmonics and trash generated by the sound card will not be filtered out by the ssb filter and much higher and the tones will be weaker.

Just remember that while using most of the digital modes you are putting out the power level you are running at all the time (100 precent duty cycle). For rtty the more power the beter, but psk31 works very well at the low power levels, that is what it was designed for . Not sure of the power of your rig, but if it is normally a 100 watt out then try running not more than about 50 watts for longer life of the rig.

you only need the autoexec and the config,sys if you are using DOS programs
win98 doesnt create them for you till you install the DOS drivers for the
sound card or the CDROM drive

OK!? So now I know it must be paid for if used regularly. I know it's a
PMS for AX25 but what the heck would I be paying for.

There is a glaring absence of the benefit. Heck! There are not even any
features listed which I might extrapolate a benefit.

Benefits people! ... and open source!

open-source and microsoft are matter and anti-matter.
You want microsoft, then you don't want open source.

Silly Steve!

Much more open source development on Windows than on
any other OS. Even some stuff that is useful ...

Well ... maybe a bit more on CP/M.

Darn little on any variation of Unix, at least useful stuff.

Hi folks,
I have a quick question Re: Kiss mode.
Are there ANY andvantage to running KISS on a TNC, rather than its own hostmode.
Eg the KAM3 when in Kiss mode looses its mailbox capability and stuff.
I wanted a dumb TNC, would I not be better with Baycom modem or soundcard ?

I also have another question re packet. I want to setup my packet station to do
something more....... I don't know what I want yet. I want something people will

want to use, and want to know what intersting stuff I could do.

I use linux for all my packet needs and I believe it will do almost anything,
I'm just after interesting ideas !

Thanks for listening !

Alan P

Alan,

Take a look at UI-View, using your TNC in KISS mode is encouraged!

See http://packetradio.org.uk

I believe there are also Linux versions of APRS software about.

Regards,

Roger Basford

If you are using windows, then go to Programs, accessories, Communications and start "HyperTerminal" which you can use to reset your PK12 and get it back to the serial port settings that PKTerm is expecting. Also try connecting it to the exact same serial cable and com port that the PK232 uses to insure that you don't have a com port/cable issue. If this doesn't help then feel free to contact me direct and we can try something else. The other thing you can do is contact CSS and they will get you going. They are very good at providing assistance with their products and they will work

```
with you until the problem is resolved.

Hi Paul, the SONY 7600G is pretty cheap... Some PCs are better than
others with respect of noise and RF. I have often thought building a
Hamcom interface with opto-isolators would be a good idea, though the
7600G seems to work ok with most of my PCs. I think the cheaper
PCR-100 does NOT do SSB so beware, the 1000 is ok though.

AFAIK,the open 1/4 wave cable is a short circuit for the concerning
frequency.Though he should take the frequency of the tv-channel for the 1/4
wave calculation.

Tom

Ah but which Arcam?

The Alpha 10 (�800) is very close to the sound of the DRX, while the new FMJ
(�1000) is a little better. (To my ears having heard all three).

But, hey, these products are respectively nearly 3 times and over 3 times
the price of the Videologic.

Therefore, if price is taken into account, I reckon the Videologic is the
winner.

T.

Thanks to all who responded to my call for help about 6 Meter TVI. I have a good base of information from which to work from.

Thanks
"73"
Dave, N1RZB

Interesting conclusion (a jealous Alpha 10 owner writes). But Arcam's Web page seems to suggest that the difference between the Alpha range and the FMJ range is mostly a matter of style and perhaps build quality. Aren't both Arcam DAB tuners built around the same Gold Card? To my untutored eye their tech specs (http://www.arcam.co.uk/alpha/tuners/techspec.html) and (http://www.arcam.co.uk/fmj/products/dt26ts.html) appear identical.

The electical circuitry is identical, but the Sontec (I think I've spelt that right) chassis does make a difference. This material is a sandwich of steel, polymer damping layer and steel, originally developed for the Lexus range of cars IIRC. Hit a sheet of it and it and it goes "donk" as opposed to "boingggg..." if you get my meaning.

We started using it in the FMJ CD23 CD player where there are clear mechanical benefits in controlling vibration to and from the drive and then specified it for the tuner 'cos it seems to have some of the same sonic benefits (somewhat to our surprise).

HTH,

John Dawson (Arcam)

I feel a bit like Woody Allen in "Annie Hall" when he's standing in the
movie queue trying to impress his girlfriend by pontificating about
Marshall McLuan, and finds the man himself standing right behind him.
Hello, John. :-)

Many thanks for the additional info.

Having heard all three (and indulgently owning two of them) I would say
all are different, the arcams rather similar and better than the VL, but
all three very lovely sounds.

hello,

> Now I understand what you are after, sure you might be able to connect
> two phone line modems with two transceivers. You need two transceivers
> at your site and two at the other site :-).

yes, you are absolutely right!
just some info on this might be very helpful and nice of you.

> One of your transceivers is constantly in transmit mode on one
> frequency band and the other is constantly on receive on a separate
> frequency band. On the opposite site, the frequencies are reversed.

yes, thats what i was talking about.
one question, is 100hz-8khz audio frequency band sufficient to the modem

connection?
i think it is more than sufficient, cause telephone lines have much worser characteristics
than my trasnceivers will have. if i can make a connection to my internet provider at 36kbps,
using my 56k modem, than i should succeed connecting two modems by radio link not less than
in 36kbps. (14kbps, or slower would be enough to me, but not some awful 1200bps)

> Any modern (>= 9600 bit/s) phone line modem needs a full duplex
> connection so that it can tune the equaliser with the training
> sequence when the connection is established.

sure, that is not a problem to me, i can make two transceivers and two receivers,
who would transmit and receive constantly at my place and the same thing in the other place.

> To get a full duplex connection using radio, you need two separate
> frequencies.

yes, i can use two frequencies to transmit and receive.
so, should i try this schematics that i sent to you, or can you suggest me some other?
in this case the PTT is not used.
i understand your explanation well, thank you for your precious time!

hi all,

now i really see that there are some people who understand
their work pretty good.
> Personally, I wouldn't bother. There are better ways of
> solving the problem.

i wonder what ways? buying a superultracool radio link 'just' for 10000$?
it was nice of you telling this information. this is helpful information,
not
babbling.
thank you in advance!

Make sure you have the unit reset. Remove JP-1 and cycle the unit. Then try again

Then do it.

Like Rob, I'm baffled at your questions - you seem to have already made your mind up about the answers.

What you ask is just barely possible in theory. In practice, it's probably not possible. If it was, everybody would be doing it and not dawdling along at 1200 baud (shudder) or 9600 baud.

The problem with rolling your own VoIP is reconstructing the packets at the other end so as not to get breaks within words. For an open source library try http://lumumba.luc.ac.be/jori/jvoiplib/jvoiplib.html

I concur on TCP for all control signals.

Why would you have breaks and what does it matter where they are?

Rob

>

Thanks David. I downloaded TIP and tried to run it, but it doesn't
support my type of drive. However, as the machine has never been

connected to the Internet, I doubt it has anything to do with Click of Death.

The more likely cause of the problem is that I recently got into the habit of leaving the ZIP cartridge in place during power-down and power-up. I discovered when reading the ZIP drive manual yesterday that I'm not supposed to do this. So, as the drive is several years old and well out of warranty, I'm going to have to bite the bullet and buy a new one.

Ian

What has being connected to the internet got to do with a hardware
failure? Its like saying "Well the tyre on the car can't be flat because
I've never taken it into Outer Space." LOL

thank you very much, but what about my question?
i asked if i could use two standard modems hooked up to transceivers?
i have some sort of schematics how to do it. but it says how two faxes
can be connected. should i try it?
of course i can send the schematics if some of you want.
so does anybody need it? or interested? i expect just a little bit of help.
thank you so much.

On a heavily loaded network you may not have even 10% available for
real-time audio.  As errors go up, packets are discarded, and quality goes
down.

It doesn't matter where the errors are.

For voice, it probably doesn't matter that you have poor quality, and still
be
able to decode what's being transmitted.  This shouldn't be the goal though.

You can make a good inexpensive notch filter by placing a 1/4 wave (on your 6M operating frequency) long piece of coax, shorted on the far end, across the input to the amplifier.

What good will that do ? I thought a 1/4 wave translated a short to an open.

What is your SWR without the tuner?
All the suggestions I just read are good.  Especially the Amplifier
part and the stub idea.

Try getting the swr nice and flat without a tuner.

There is NO REASON a tuner should be needed on a 1/2 wave coaxial fed
dipole. Unless your operating way off its frequency.  And if you are,
that in itself will contribute to the TVI problem.

  *OPEN* on the far end!

Best use a piece of 'large' coax.  I've used 3/4" cable TV hardline.
It's notch is wide enough that you should cut it low in freq. to keep
from killing any TV2 signal.  Cut it for 49 - maybe 48 mcs --- you
can always cut long coax shorter, but you can't cut short coax longer.

If by "standard modem" you mean a telephone dialup modem,
no, it won't work.

I tried searching altavista for packet radio and got a
huge number of responses, almost all of them useful.
Please remember that information doesn't grow on the
Internet by magic; somebody must place it there, and they
must have a reason to do so. If you don't find the
information you seek, you should put it there yourself.

Make that 1/2 wave and you might see a notch :-) on that frequency
(and remembering to compensate for the velocity factor) if you are
using shorted stubs.

A 1/4 wave _open_ stub could also be used, but it is harder to tune.

Search for WinPack ! It's free to try and unblocked. It also can use AGW (soundcard) Packet Engine. Let me know if you need help ajusting it's settings.

AGWPE can be used with Baypac and regular TNC's too.

Is there a "coordinated" frequency for running 19,200bps data in SoCal - specifically San Diego. What bandwidth do the TEKKs require when running at 19,200bps? 50Khz?

Now that the SCDCC has gone belly-up, is there a coordinating body in SoCal that gives a rat's ass about digital applications?

Here were the latest SCDCC "coordinated" band plans for the usable part of 70cm(my understanding that the lower part of the band is useless because of RADAR):

438.950 S 20K0 F2D 9600 Baud - TCP/IP - Los Angeles (Malibu - Torrance)
438.975 S 20K0 F2D 9600 Baud - General Use
439.000 S 20K0 F2D 9600 Baud - AX.25 BBS Mail - Ventura-LA-Las Vegas Fwd
439.025 S 20K0 F2D 9600 Baud - TCP/IP & Net/ROM Nodes
439.050 S 20K0 F2D 9600 Baud - AX.25 BBS Mail - San Diego "MetroLINK" LAN
439.070 S 15K0 F3D 1200 Baud - General Use

If I set up a link with two 19,200bps-modified 5W KS900Ls using directional beams on 439.975 between SDSU area and the Intl. Border - would anybody care?

Stussy - why didn't you tell me they were REALLY going to disband SCDCC, I would have gone to the meeting! Can't we resurrect this beast?

Laura, I do not think such a high number of results does have to mean
quality. Every URL without any connection to the search in question simply
is wasted time. How many of the users would search through to hit number
188,000?
 ;-)

I prefer less hits. No junk. So does my search engine, for radio amateurs
and short wave listeners. "Only" 21,000 links in total. Within 62
categories.

The "only" 62 links you get when searching for packet, will keep you busy
for a while, I guess.
And even one link that does not offer what the description says, is worth a
notice to me.

BTW: The site got the Radio Netherlands Media Network Millenium Innovation
Award in 2000.

73, enjoy the hobby.

At least one "commercial" oven I turned into a plasma excitor was full wave rectified. I'm sure because the filter caps and linear regulator I added had very limited margin. The oven was just a little beefier like you might find in a vending area, Amana I think.

No doubt what you describe is the norm, but it could be kind of ugly on the power factor if a Motel hooked all their microwaves on the same side of the incoming power circuit ;-)

Buy a new Zip drive. That's what I had to do. Mine was made by
Panasonic and failed after 2 years.

The software which came with the replacement I bought attempts
to solve the problem (mentioned in another post) of leaving
media in the drive, by ejecting the disc when you close down
Windows.

Another problem with leaving discs in the drive is that
Windows '98 will often swop the drive letters around at
random on booting. Particularly if you have two partitions on
the HD, a CD-R/W and a RamDisc. A real pain for the forgetful.
Fixing the drive letters in Device Mananger achieves nothing.

Ooops - I should have said open on the far end - that will cause a low impedance at the amp input for the 6 meter frequency.

The disbanding motion WAS ON THE AGENDA which was posted on the SCDCC's web site about 2 months before the meeting, in addition to being documented in past general meetings' minutes (where it repeatedly failed). All I can say is that the public had notice yet NO ONE CARED to show up (beyond those who actually did) and that it did NOT pass unanimously.

As for use of those frequencies, SCRRBA was also a party to that part of the bandplan. However, I will concur (as an individual) that if there is no objection to such operation within 3 months after it starts and your signal is within the bandwidth specified, go for it.

Why ?
I would have thought that cutting coax stubs is as easy / hard for
1/2 wave as it is for a 1/4 wave !!

>

Try feeding the dipole so that it has balanced RF current.
use a Balun or make a pawsee stub at the feed point
a Dipole if cut right is about 70 ohms  so SWR 1:1.3 is about
OK with no tuner (the PA in the rig should handle this with out
shutting down)

Sticking a needle through the shield and the centre conductor is a reversible operation, cutting the coax is not a reversible operation.

True. I never implied otherwise.

However, the very first hit on both hotbot and altavista is TAPR. If you can't find what you want there you are probably looking for the wrong thing. Or just don't know what you're looking for at all.

TAPR is followed by many pages of packet radio-related hits before you start hitting pages about cigarette packets and radio stations.

```

As I recall it, the roughly 50% duty factor of microwave oven radiation is not due to half wave rectification, but due to lack of any filter on the rectified HV supply. The magnetron only fires when the voltage exceeds some fairly high threshold, so it is quiet near the zero crossings of transformer output.

```

In brief, I have a multi element TV antenna with a amplifier connecting to 4 televisions. The house lot is laid out in such a way that it's very hard to string antennas up with out having them in close proximity to the TV antenna. Cable is not an option. Satellite is possible but would like to keep regular TV antenna.

At Christmas I found a Six Meter rig under the tree.(MFJ 9406 SSB/CW 10 Watts) which my wife gave me. I put up a dipole to try it out and to my surprise it works quite well. With a antenna tuner I have a 1.3:1 SWR.

My wife hasn't stopped yelling at me sense. Every time I key the mike or try out CW the TV's go blank. I have tried a HI PASS filter but that doesn't do much good at all.
My HF rigs cause no problems at all. I do have a good RF ground

WHAT AM I DOING WRONG??? HELP!!!

Any comments and suggestions would be gratefully appreciated.

Thanks
DAVE, N1RZB

Dave, the 6 meter band's fundemental frequencies fall close to the
video portion of the television
signal. Plus, you're probably experiencing what is known as fundemental
overload. Your tv's are
acting like a receiver for your nearby 6 meter transmission. The tv's
don't have the proper
filtering to filter it outand reject that signal. The FCC sees Amateur
to non-amateur interference as not necessarily the fault of the
amateur. Usually, it's the fault of the manufacturer of the consumer
electronic device for not puttting in the proper filters and shields.
If there are no supurious emissions
from your station, then fundemental overload is the culprit. The ARRL
RFI book may give you some ideas on fixing the problem.
Did you try choke filters ont he tv(s)? That amplifier may be letting
in extra signals, too.
Good luck.

Does the software for this PC radio work in Windows 2000?

Does anyone own one of these receivers?

Is it any good?

Where can I get a cheap one

Cheers

Jim,

Re COD: my advice - visit Steve Gibson's site (www.grc.com) and look for his extensive notes on this COD problem. He also has (definitely HAD) a test program in there, to see how your ZIP drive is running...

Re Iomega: I think the Iomega folks are trained to "not know" <g>. However,
not only do they know, but, as far as I recall, some of the big guns in
Iomega have promised that every COD problem drive will be replaced,
anywhere, AT NO COST, and irrespective of warranty periods.

Hi

Cutting a stub to the correct length is like playing Russian roulette.
The alternative is to cut the stub shorter than the calculated length
either quarter or half wave and use a small trimmer capacitor. Use one on
the input to the Amp and one on the out put as well. My experience
suggest that most on the damage occurs in the TV set mixer.
you can locate a stub if necessary at the TV set as well. I have had a
good results with co ax and trimmer it is very easy tune. After a while
you can simply guess the length of coax and tune the trimmer.
Regards Alan
VK3ry

Let us assume that the interference is really being caused by your very strong 50MHz signal getting into the antenna amplifier via the input connection (I'm sure that this will be the main cause, but it may not be the only problem). However, what you essentially want is lots of attenuation 50 - 52MHz, and as little as possible elsewhere. However....

Using coaxial stubs CAN be very effective, but there are several serious problems with simply adding a simple o/c quarterwave or s/c halfwave stub across the input of the wideband amplifier. These include:
1. The width of the notch will be so wide (even with the lowest-loss coax you can find) that you will also kill the TV low-band (Ch2 - 55.25MHz - will, of course be the worst affected).
2. As well as having a notch on 50MHz, here will be notches at odd multiples of 50MHz (if quarterwave) and all multiples (if halfwave). This may make a bit of a mess of several other TV channels.

The obvious solution to the width problem is to make the notch narrower. With stubs, you can do this by cascading similar stubs, each separated by a quarterwave of coax. This will also greatly increase the depth of the notch. A single stub will give you a notch of 25 to 30dB, and two stubs will increase this to nearly 60dB (I doubt if you'll need anything like this). However, this will not change the 'harmonic suck' effect (although these sucks will also be narrower).

You cannot eliminate the multiple harmonic sucks, but you can move them around so that they do not fall on those frequencies which you want to receive. You can do this (for example) by adding capacitors or inductors in the appropriate places (I won't go into this here).

You will probably be better off with a circuit using only capacitors and inductors. However, there will need to be more to it than the simple equivalent of a single coax stub. I have a typical circuit in mind, but you would have to calculate the values or do some 'jiggling' to values obtained by means of 'inspired guesswork'!

Having said all this, I'm sure that you are not the only one having trouble with 6m hitting TV (antenna amplifier or not). I wouldn't be surprised if there are several off-the-shelf filters which are purpose-made, and don't cost too much. If not, let me know - I'll move to the USA and set up in business!

73,
Ian.

You could step up to 100mb/s and cut the time delay between lost
packets. 100mb/s is as cheep and available as 10mb/s... maybe even
more so in the future...

Dave -

Traditionally, 6m has been the best way to get the "Worked all channel 2's" award. Various low and high pass filters, even (maybe especially) those that are effective on HF tend to be ineffective on 6m. The main problem is that 6m sits right in the middle of what would've been TV channel 1. TV sets tend to have RF front ends that are very poor in terms of strong adjacent channel signal performance. Also, TV's are usually poorly shielded (how many 15KHz harmonics can you count?) so 6m will be picked up by the power wiring and the TV circuitry itself!

What to do? I can't say what if anything will work for you, but here are a few things to try. I'm assuming that your 6m rig is clean, so my suggestions all apply to the TV system. 6m harmonics should not be much of an issue even if present because they impact only one VHF TV channel (11 I think). The basic goal here is to reduce the 6m signal strength at the TV's, TV amp and TV antenna.

1. Move your 6m dipole as far from the TV antenna as possible. The dipole is physically small (10' or so long), so this ought to be easy to do.

2. Keep the 6m and TV ant cables as far apart as possible. You say that you get an SWR of 1.3:1 WITH a tuner? Better to adjust the 6m dipole so that you have a low SWR *WITHOUT* the tuner, assuming that you're feeding the dipole with coax. If this turns out to be the problem, a "current choke" balun at the dipole may also help. If you're feeding the dipole with twinlead, you need to be more careful about what is near the twinlead's path from the antenna to your radio. In either case, the idea is to prevent the 6m antenna feedline from radiating.

3. Orient the 6m dipole so that the TV antenna is directly off the end of the dipole. Putting the TV antenna in an antenna null is the simplest way to reduce the 6m signal level at the TV antenna.

4. Choke/filter the AC power lines feeding the TV amplifier and the TVs. Radio Shack (and others) sell a ferrite core for this. I think they're fairly inexpensive - $3 for 3 or so...

5. Build quarterwave stubs tuned to 6m and install them at the antenna inputs to the TV amp and the TVs. This will selectively reduce the 6m signal level to the amp/TVs. It's possible that the only one you'll really need is on the TV amp - assuming that it's the only box being overloaded. If channel 11 is used in your area, the stub may also affect it. If so, the stub may not be a good idea. (BTW, the halfwave stub suggested elsewhere would also affect the 2nd harmonic of 6m. Lucky for you, 100MHz is not a TV channel. Unlucky if you're using the same antenna for FM broadcast!)

Good luck. Enjoy 6m!

73 de Glenn wb6w

Click of Death fans:

Yup there really is a "click of death", God Bless Iomega....  I got it
too...

I think I saw a USENET NG dedicated to the "Click of Death".

Why not take the discussion there...

Cheers,

-Peter  K1PO

I've released version 3.9.0 of MultiMode, my shareware program that allows the transmission and reception of morse code, slow scan TV, PSK31, and other modes.

The latest version of MultiMode adds:

QRSS (very slow morse code) as a Spectrum/FFT mode, with a waterfall display

Spectrum mode now displays peak frequencies

Improved ACARS (Aircraft Communications Addressing And Reporting) mode decoding

Better alignment of SSTV (Slow Scan TV) images
More readable transmit font in Hellschreiber mode

MultiMode is shareware, and may be downloaded from the following URL:
http://www.blackcatsystems.com/software/multimode.html

Can the KPC-3 be modified to work any packsats? Mine has been sitting around new since use and I'd like to know if this mod can be done (looks simple enough) and will the KPC-3 work properly in this application. Everything I have read about the mod talks about TAPR tnc's. Thanks

I have a rigblaster and am using it with a non-soundblaster card. the connection was easy...and the speakers work. according to the book this means the sound card is hooked up properly. the soundcard itself also works with .wav files, etc.

HOWEVER, the card isnt working with the programs included on the CD with the rigblaster. when i put the rtty program online, and tune in a rtty signal, no data appears on the screen. also, when i try to transmit, using 'vox' mode, the program ignores it. any suggestions? thanks all. email is wf3h@ptd.net.

rig by the by is an ic756pro. computer is 200 mhz pentium with win 98.

It's not the Rigblaster but the software. Some non-soundblaster cards
have this problem...

I'd like to build a remote radio setup that would consist of a computer
controlled radio (TenTec Pegasus) and computer, installed in an enclosure at
the base of my tower and connected to a remote computer via Ethernet. I'd
like to connect the mic and speaker at the remote computer to a sound card
and have the audio digitized and sent over the Ethernet to the computer at
the tower where the radio would also be connected to the sound card

I'm looking for some routines that can be used to provide the D/A and A/D.
Since I write programs for Windows for a living, I'm planning on using
Windows as the operating platform. I'd like DLLs or OCX's or similar
routines. Also, is this approach practical?

When you program for Windows you should be familiar with the APIs available from Microsoft and the way to get development software and documention, I think... their "multimedia API" (DirectX) should provide everything you need.

Of course it is practical. But you should consider that there will be a time delay, as at several places the samples are usually manipulated in chunks that are to be collected first, then sent over the link and to the soundcard at the other end.
Remember that a delay might not be that much of a problem with halfduplex communication, but it will increase the chance that you grab the mike and transmit while another station has been doing the same (but you did not yet notice).

For duplex or full-breakin CW, any delay will be very disturbing.

Rob

I've recently been fooling around with some 802.11 wireless Ethernet hardware (Lucent Orinoco) at home. It seems to be working well for the most part, but I've been seeing severe dropouts on a very occasional basis due to the appearance of a fairly-strong interfering signal close to where the Lucent hardware operates. Typically the interfering signal has been popping up late at night (around 1 AM local time) and lasting for only a few minutes before going away. It's not causing any real grief but I'm curious where it's coming from.

Last night, the QRM lasted for quite a while, and I managed to catch the culprit on my SA. I don't have a portable receiver for this band to help track down the signal, but I would be curious if anyone recognizes its spectral footprint and can tell me what kind of device to look for. I haven't run across anything like this before -- it doesn't look much like a microwave oven, and it doesn't look anything like another 802.11 device.

The signal at http://209.95.122.40/jm/qrm.gif seems to consist of an asymmetrical series of decaying sidebands roughly 2.6 MHz wide, starting around 2.4615 GHz and taking up about 10 MHz of space at its -6dB points. What kind of device is doing this, and who do I yell at to make it stop? :)

The FCC rules state that part 15 devices may not interfere but also that they must _accept_ any interference, and this is also printed on the part 15 hardware tag, that appears to be a penalty of operation in the ISM band.

:-(

What channel are on operating on? The receiver responds to +/-8MHz about the carrier, so Channel 1 at 2400MHz would appear to be unaffected by the interference. Likewise a higher channel might be safe (802.11 channels are spaced every 5MHz). How stable is the frequency of the interferring noise? It's likely a high harmonic of a spike signal... Have you been able to see any of the other harmonics? This would allow you to calculate the basic repetition rate, which might provide a clue.

Let us know what you learn.

Thanks,
- Win

My first guess, no-one, as per the FCC part 15 status of the 802.11b
device,
it must accept interference, including that which may cause unesired
operation, you
know it all.

Look up Seattle wireless to learn how to at least build a directional
2.4 Ghz antenna (I might be tempted to try and borrow an MMDS
downconvertor,
an find a portable SA to at least find where it's coming from, than if
they have
a licence to transmit there.

Isn't 2460 MHz used for microwave ovens?

Just a thought: Could the culprit be one of those new 2.4 Ghz Digital, SS or Non-SS (Spread Spectrum), cordless telephones like some of the models vended by Panasonic under the GigaRange brand name? SS phones only stay on any one channel for a little while and try to avoid occupied channels so that might explain why you only occasionally experience interference from one of these gizmos. And I believe they share some of the same frequencies as 802.11, but I'm not sure on this - if they do then they're a potential culprit.

Sorry that I can't be more help, but I'm looking into 802.11 wireless for a part of my home LAN and when I spotted your post I just had to but in.

I watch for new postings this thread but I would appreciate it if you'd email me if you do identify the culprit. Especially if it turns out to be a 2.4 Ghz cordless phone - I've got one so I'm naturally curious.

73 for now
Peter Vince VA3PKV

Because the interference occurs at 1 AM, I beleive it is a microwave data transmission (from a bank or something), if not, probably a genuine ISM emission
(like weather radar maybe)

John Miles wrote:
<snip>

I'm pretty sure it's not an oven, because it's a relatively stable signal. (At least in the shot I took, that is. I didn't think to zoom down on one of the lobes.)

I just took a picture of the Panasonic 1100W microwave in my kitchen, at http://209.95.122.40/jm/uwave.gif. If you look closely you can see my 802.11 signal foundering in the swamp of garbage from the microwave, at around 45 dB below the oven noise.

(Fun factoid of the day: the microwave and the 802.11 access point are both located about the same distance -- 30 feet or so -- from my workbench. This suggests that you'll get about 10,000 times the RF exposure standing next to a microwave oven, than you would from an 802.11-equipped laptop. :) I didn't think ovens leaked that much.)

Win's suggestion of an impulse-noise harmonic seems intriguing -- J.C. Bose successfully ran a spark gap transmitter at 60 GHz in 1905, so I guess anything's possible. But it sure looks like some kind of band-limited DSSS signal to me. A periodic data dump from a nearby bank or store could make sense; there's a lot of commercial/retail property on my block.

The main lobe's width suggests a data clock rate of around 1.5 Mbps if I understand the theory correctly, which seems like a common-enough data rate (DS1 telephony, SP/DIF audio, etc.) However, the book I have suggests the side lobes should be half the main lobe's width, while they appear more like 80-90% as wide in the shot I took.

At any rate, the 802.11 access point is using channel 10 by default, so it looks like I could miss the interference easily enough by dropping down a few channels. It'd still be interesting to figure out what's going on, though. I wrote some waterfall-display code a couple of years ago and it's still lying around here somewhere... when I get some spare time I'll hook it up to the GPIB card and do a 24-hour survey of the whole band.

Will post the results if I find the source. Thanks for the input, it's appreciated!

Rob,

Thanks - the delay wasn't something I'd really considered. Thanks for the
tips on DirectX. I hadn't thought of that either, but I was assuming that
the core Windows routines would be to slow and bulky for my needs. I was
actually thinking of something like RealAudio.

Mark

Don't try anything like RealAudio, the delay will be terrible.
You don't need to compress the audio in any way to send it over ethernet!
Just sample at the rate you like and package it for transmission using a

network protocol. UDP will be used by purists who claim that TCP can introduce arbitrary retransmission delays, but over a local area net I would probably use TCP. (no need to worry about possible data loss by collisions)

Well, I surely did not intend to create a fuss ... and I don't think I have. I asked a simple question, and after a few replies I believe I have my answer ... it appears to be a government station of some sort operating in a shared bandwidth area.

Thanks to all for the positive and informative information folks.

All station control signals (PTT, frequency setting etc.) should go
over TCP, but I would definitely use UDP, if the audio data rate is
more than 10 % of the transmission medium throughput. However 64
kbit/s audio over 10 Mbit/s Ethernet is certainly below that.

>but over a local area net I
>would probably use TCP.

The problem with TCP is that it will fill up the transmission frame
buffer and at some time (which is not well controlled by the user)
decides to send a frame. With Ethernet frames up to 1500 bytes long

and a data rate of 8 kbytes/s, it can take up to 180 ms to fill up the buffer, thus, there could be a 180 ms timing jitter for some samples. With 180ms jitter and the buffering of the reception, there will be a 180.. 200 ms delay between the transmitted and received audio.

Depending on the TCP/IP stack parameters, TCP/IP will send out packets before they are completely filled, thus reducing the jitter. From this point of view, it can be an advantage to use a higher sample rates and longer sample lengths than strictly necessary, since it will fill up the buffer faster, thus, triggering the frame transmissions at a higher rate, reducing the jitter between the samples and thus reducing the total audio delay.

In UDP, you can set the number of samples to be transmitted in a single frame from 1 to 1400 samples (or 700 samples if longer samples are used) and have full control of the delay / jitter.

>(no need to worry about possible data loss by
>collisions)

The important thing is to know _if_ samples are missing e.g. by using a counter in the frame, so that you can generate the missing samples by averaging between the last good and next good samples.

Hi, I am totally new to the world of Amateur radio and would like to experiment with digital data, such as NAVTEX and Weather charts. I would be using programs like, JVFax, JVCOMM, HAMCOMM, RadioRaft and Sky Spy.

First I need a receiver. As I will be doing a lot of interfacing with the PC I though the ICOM PCR-1000 would be a good start. Has anyone here got this receiver or know if it will be a good receiver for my needs.

Also where would I get good info on amateur radio for beginners? Is there any web sites dedicated to the topics?

Thanks for your help

i tried search engine and not just one time, thats for sure ;)
in turn of your help i would like to give you one, but good link about that
stuff.
here it is:
http://www.stack.serpukhov.su/~victor/hamradio/packet/packet.html
now this is what i call a good page, a lot of schematics, and other, faq..
and so on.
tell me what you think about it. i think it is really good.
i found some modems made with FX614, 604 there.
and i think it could be a nice start fo me as a beginner.
i hate pages with commercial stuff, something like 'buy license for
program',
'the PIC microcontroller source code is not for public, BUY IT!' now that
just drives me NUTS!
oh, and that http://www.tapr.org/ doesn't have much info,
just a lot of babbling, nothing more, not even some radio modem schemes.
ok, ok, there are three schematics, but is it enough for the newbie?

i would like something not to complicated, maybe something about
"connecting two standard phoneline modems by receiver/transceiver"
i think you got it. is it possible to use standard modem for that?
i think it is, because telephone line frequency band is really more narrow
than
the one used by standard transceiver/receiver. i think the connection would
be not
less than 56kbps! or is it wrong?
thank you very much for your precious time.
sorry for my english.

Who ever said there was a fuss? People have been monitoring UTEs for
years. It's part of the hobby.
Pete

i tried search engine and not just one time, thats for sure ;)
in turn of your help i would like to give you one, but good link about that stuff.
here it is:
http://www.stack.serpukhov.su/~victor/hamradio/packet/packet.html
now this is what i call a good page, a lot of schematics, and other, faq..
and so on.
tell me what you think about it. i think it is really good.
i found some modems made with FX614, 604 there.
and i think it could be a nice start fo me as a beginner.
i hate pages with commercial stuff, something like 'buy license for program',
'the PIC microcontroller source code is not for public, BUY IT!' now that just drives me NUTS!
oh, and that http://www.tapr.org/ doesn't have much info,
just a lot of babbling, nothing more, not even some radio modem schemes.
ok, ok, there are three schematics, but is it enough for the newbie?
i would like something not to complicated, maybe something about
"connecting two standard phoneline modems by receiver/transceiver"
i think you got it. is it possible to use standard modem for that?
i think it is, because telephone line frequency band is really more narrow than

```
the one used by standard transceiver/receiver. i think the connection would
be not
less than 56kbps! or is it wrong?
thank you very much for your precious time.
sorry for my english.

John, the conventional wisdom is that a microwave oven operating on
FULL is actually on a 50% duty cycle at 60Hz, i.e. powered on half
cycles only. 802.11 modems are supposed to sucessfully sneak their
packets through undisturbed during the quiet 8ms periods. The MAC
chip should make automatic retries until finding the quiet interval.
What have been your observations about this?

BTW, I like the 7470A plotter emulator software, we'd you get it?

Thanks,
- Win

YOu did not give the country from which you are from. Maybe the UK in the address is it. I don't have any thing from there, but you may try searching for the Radio Socity Of Great Britian. For the United states go to wwww.arrl.org. Every country is differant on what and how to get an amateur license. Most have some sort of national club to get help from.

Look here for some softwear that uses the sound card of the computer for the digital modes.

Which search engine?

People routinely post stuff like this, and I'm baffled:
whenever I use any reasonable search engine I get more
information than I know what to do with. For example,
I just tried "packet radio" on hotbot and got 188,000 hits.

If there are dud search engines out there, please tell
which ones so we can avoid them.

The MAC chip should make automatic retries until finding the quiet interval. What have been your observations about this?

I can still surf the web OK with the microwave on, but LANEVAL reports zero throughput for some reason. Maybe it tries to keep the wire saturated without backing off to allow the necessary retries... dunno.

There's an option in the Orinoco client software for "interference robustness" that's specifically intended to deal with oven interference. It evidently breaks the packets up into smaller fragments that are more likely to fit into the quiet half-cycle periods. It doesn't seem to help LANEVAL, although I didn't try enabling it at both the client card and access point.

> BTW, I like the 7470A plotter emulator software, we'd you get it?

Thanks! I wrote it to parse the output from my Tek 494P's PLOT? command. That's a fairly-old instrument (Reagan-era eBay special), and it only uses a few basic HPGL commands that were easy to reverse-engineer by looking at a sample plot file. You're welcome to the C source, but it's not likely to work with any instruments besides the 49x analyzers yet.

If I can find a reference for the 7470A somewhere, I'll try to bring the emulator up to date with all of the HPGL commands from that generation. I'd like to use it with my 2430A scope too, but its HPGL output looks much harder to reverse-engineer than the 494's. Font support is going to be a PIA in either case because my (also homebrew) graphics library doesn't do scalable fonts. I'll probably have to switch over to GDI if I go much further with it.

FYI, I've uploaded the current version of my HPGL plotter emulator to
http://www.qsl.net/ke5fx, with full source.

It will probably take some effort to get it working with anything but
the Tek 492/494/495/496/497 analyzers, but it ought to be better than
nothing as a starting platform. I'll add vector fonts to it as soon as
I can find an HPGL reference of some kind. Suggestions are always
welcome....

I have an internal 100MB ZIP drive that has apparently started to have
seek problems -- when running Norton Disk Doctor, the surface check
regularly fails around the middle of the disk, and I can hear the head
assembly repeatedly clicking as it retries.

I've tried several disks, some fresh, some old, and all exhibit the same
problem, so I'm certain it isn't the media.

Unfortunately the drive is held in place by screws that are very
difficult to get at, so before I completely disassemble the computer, is
there anything else I can do to identify/fix the problem with the drive
in situ (e.g. cleaning)?

Ian -
    you want to take a look at

```
http://www.grc.com/clickdeath.htm
    if your drive has contracted the 'click of death' you should be able to
get a free
replacement from Iomega
                   regards
                      Tom

Hello
I had quite he same problems on my own Zip drive.
That's a mechanical fault recognized by IOMEGA,fortunately the
equipment was still under warranty and I got it freely replaced by
IOMEGA in Netherlands.
Good Luck
s73 Charles SWL

IOMEGA ZIP Drive "Click of Death" syndrome. Made big news a while back.
Earlier ZIP drives were well known for failing because of this.

 I suffered from this initially but manager to source an up to date driver
for the machine and since then i has worked faultlessley.

Sounds like what is known as the Click of Death, which at one time was more
common on early Iomega Zip drives. Try the following lin it may help.

Good advice from Tom. The GRC (Gibson Research Corp.) site is excellent.
If I remember right, the drive may turn out to be OK. It depends. One thing
others did not mention is a free software on the GRC site called "TIP"
(Trouble in Paradise). It will figure out whether the drive or the media are
at fault. The picture does get cloudy, however, if you have both bad media
and a bad drive at the same time. Anyway, read his site. TIP is excellent
and I use it from time to time to check my drive and media. It is well
worth the effort to get it and run it. Takes a while to run, even on the smaller
100M size media, but very informative and definitely worth taking the time
for. 73, David K3KY

Anyone know where to buy these things individually as opposed to bulk? I just want a few so I can add digital outs to some audio gear.

Is there a decent packet BBS program available that will run on a Windows-based PC? If so, could you please provide any links or suggestions as to and WHERE it might be found, and WHAT it is know as?

For reasons not fully explained or understood, we think we might want to get a little packet activity going around here again.

Thank you very much for any assistance.

73 de John

In brief, I have a multi element TV antenna with a amplifier connecting to 4 televisions. The house lot is laid out in such a way that it's very hard to string antennas up with out having them in close proximity to the TV antenna. Cable is not an option. Satellite is possible but would like to keep regular TV antenna.

At Christmas I found a Six Meter rig under the tree.(MFJ 9406 SSB/CW 10

Watts) which my wife gave me. I put up a dipole to try it out and to my surprise it works quite well. With a antenna tuner I have a 1.3:1 SWR.

My wife hasn't stopped yelling at me sense. Every time I key the mike or try out CW the TV's go blank. I have tried a HI PASS filter but that doesn't do much good at all.
My HF rigs cause no problems at all. I do have a good RF ground

WHAT AM I DOING WRONG??? HELP!!!

Any comments and suggestions would be gratefully appreciated.

Thanks

f6fbb at http://www.f6fbb.org runs in Windows.
I use the Linux version, but I have heard people
run it in Windows on the email reflector.

Yeah, percussive maintenance.

But seriously, sounds seriously fscked to me. In or out of situ, I
doubt you'll be able to do anything about it, unless it's still within
warranty.

I had one fail on a machine at work. (wasn't aware this was a common problem,
but what's described is exactly what happened to ours)  The computer was
neither a Mac nor a PC; it was a Chyron TV title generator.  (Motorola
68040, I think the OS is called "PSOS".  SCSI interface.)

Anybody using broadband antenna amplifiers are just asking for
trouble. If it has a frequency response something like 47 .. 860 MHz,
then there is no wonder that it is going to saturate :-).

Are you absolutely sure you need amplification for VHF channels ?
Wouldn't it be sufficient to put a UHF only amplifier directly after
the UHF antenna and just use a passive summing network to connect the
VHF antenna into the downlead ?

If this is not possible, but Band I is not needed (channels 2 .. 6 in the USA), put a high pass filter around 150 MHz immediately in front of the preamplifier.

If Band I channels are required, put a 50 MHz notch filter immediately in front of the amplifier and make sure the amplifier has a good metallic cabinet so that your transmitted signal does not go directly into the amplifier.

Here is a link that explains why the interference is probably NOT due to microwave ovens:
http://www.cts.com/browse/solectek/tech-center/tt-microwave.html

I couldn't find a link, but I have seen an article explaining why you should not use 802.11 around fluorescent lights due to interference problems. You

might want to explore this possibility (especially if you have a bad ballast).

I have not heard of PSK32. Maybe you saw a typo.

But in STREAM by IZ8BLY, there are other MORE effective PSK modes namely PSK63F and PSK125F. Both have FEC and are faster than PSK31 and best of all they are easier to tune.

Hello All.

I need help with 'writelog' the log program. I would like it to be a 1on1 help. If somebody could find the time just to explain a few things I would be extremely happy.

Regards to you all.
Jim Irving (ZL2BMH)

The rapidly-expanding Family Radio Service has exposed millions of young people to the world of radio communications. But now, where is a young kid to go who has is interested in experimenting with radios and get more range than the typical 1/2 mile of FRS? MURS might help a bit(if Motorola doesn't get their way), but you know that a growing mind is eventually going to want more than just this. GMRS doesn't have the resources, and is not a service that was created to foster experimentation. Like it or not, the typical young person ends up cutting his radio experimention teeth in the Citizen's Band service, because there isn't a reasonable entry-level ham license for kids(it is even worse now after restructuring, what with the elimination of the Novice Class).

Everyday now the USA is falling further and further behind Europe and Japan in the wireless communications race. As hams, it is time we make an effort to insure that our young people are provided with the proper environment, incentives, and role models to properly learn radio communications techniques and etiquette.
It is time for hams to stop complaining, step up to the plate, and take an active role in seeing that our bright, young technical minds are being taught properly.

As a result of this, I have reworked the Communicator entry-level license proposal I submitted to the FCC last year, and I will now be proposing a new entry-level Amateur Radio class known as the "Colt" class. I submit a draft of the proposal for your review below. Please keep in mind that the future of American involvement in wireless communications development depends on us to properly encourage and teach tomorrow's experimenters, operators, technicians, and engineers...

****

Proposal to FCC to institute an introductory-level "Colt" license class in the Amateur Radio Service - REV A

In the late 1980's and early 1990's when the current Amateur Radio Service Technician Class license was conceived and implemented, it was an appropriate alternate introductory license class. However, due to the recent elimination of the Novice Class license, and as a result of improving technology; the Technician Class license no longer serves well as the only introductory license, as it is doing poorly in drawing young members into the Service. As a result of license restructuring, it is now actually harder for young people to obtain an Amateur license than it was before restructuring.

In this critical era of global competition, especially in the wireless communications arena, it is essential that we provide a means for properly educating our young people in RF communications operation and theory.

Today, technologies like the Family Radio Service, high-speed telephone & cable modems, the Internet, and inexpensive cellular telephones, have overshadowed the privileges of the Amateur Radio Service, and made the requirements for young beginners to obtain a Technician Class license out of date. Additionally, the Technician Class license has now evolved into a beginning and ending point for most modern day Amateurs, who are mostly interested in VHF/UHF communications, rather than HF communications. Incentive licensing has virtually been eliminated.

The need for a Service dedicated to the goal of teaching young radio users proper radio operation techniques and etiquette can clearly be seen in the disarray present on the 11 meter Citizen's Band Service frequencies. The fact is, the Citizen's Band has become the defacto introductory service for young people just beginning to learn to experiment with radio; yet the Citizen's Band is a very poor environment for young people to be learning in.

Therefore, it is recommended that a new "Colt Class" license be added to the Amateur Radio Service expressly to encourage young individuals to enter the Amateur Radio Service to improve their understanding of RF communications theory, provide a healthy learning environment, and encourage radio experimentation.

On the 70cm UHF band, Colt licensees would be restricted to voice communications on 5 simplex-only 20khz-spaced channels on 446.00, 446.02, 446.04, 446.06, and 446.08 Mhz; and digital communications up to 19,200bps on 1 simplex-only 60khz bandwidth channel on 446.14Mhz.

On the 1.25m VHF band, Colt licensees would be restricted to voice communications on 5 simplex-only 20khz-spaced channels on 223.42, 223.44, 223.46, 223.48, and 223.50 Mhz; and digital communications up to 19,200bps on 1 simplex-only 60khz bandwidth channel on 223.56Mhz.

To encourage experimentation/understanding of antenna and VHF/UHF RF propagation theory, Colt licensees would also be allowed to setup and/or operate through a VHF/UHF crossband, simplex user input/output, repeater station on two 20khz-bandwidth channels on 223.52Mhz and 446.10Mhz. This would allow them to setup an inexpensive repeater system by interconnecting the voice/mic connections via a resistive circuit on two simplex radios; and would not require expensive, and difficult to understand, cavity and duplexer filtering at the repeater station site. User radio costs would be low, as they would only need a single simplex radio. As a result of the characteristics of this type of repeater, the repeater builders and users would learn to coordinate frequencies, and user groupings based on environmental conditions, so as to acheive optimal results.

Colt license users would also be subject to the following restrictions:

(1) Individuals applying for a Colt Class license must be under 19 years of age at the time of license application or renewal. The license is valid for 5 years.

(2) Fixed control station antennas will be no more than 6.1 meters (20 feet) above the ground or above the building or tree on which it is mounted.

(3) Transmissions limited to 5 watts ERP, or less.

The new license class would have the following goals:

1) Encourage more young people to enter the Amateur Radio Service, by providing an entry-level ARS license class that includes privileges allowing reliable short-range voice and data communications.

2) Not significantly impact existing users of the affected Amateur Radio Service frequency bands.

3) Encourage basic knowledge of radio, electronics, operating principles and etiquette among a wider segment of the general population.

4) Take advantage of the success of the Family Radio Service, and provide a path for those young users interested in further radio experimentation.

The Colt license exam would consist of 25 fairly simple questions. Emphasis would be put on understanding the existing operational, safety, etiquette and emergency questions from theTechnician Class question pool that relate specifically to Colt Class license privileges. All questions containing calculations would contain small integer(whole-number) input values and have relatively small integer results. Colt licensees would be required to have a general understanding of Ohm's Law and Power relations. They should be required to have a general understanding of how antenna length relates to wavelength; and have a knowledge of transmitter power, antenna gain, transmission line loss, and the ability to perform a simple ERP calculation

would be required. General knowledge of simple resistive circuits, and
their power dissipation, would be required. Knowledge of capacitors and
inductors would not be required.

If you respond to the Colt License Proposal thread, please drop
alt.radio.family from the header. The majority of FRS users are simply
American families using these low-powered radios as short-range "intercoms".
They are not radio hobbists. Thanks.

The Technician Class license is so easy to get now it's not even funny. You
sure you are not being a little jaded in your view when you think every kid
wants to work DX on H.F., hence starting out on CB Radio shooting skip?

I have a four year old laptop computer I don't use much these days. I think it has enough processor power to be useful for sound-card based digital modes. But, I have never seen a PCMCIA sound card. For my intended purpose a card would obviously have to work with standard (Soundblaster compatible) software.

Do such devices exist, and if so does anyone have recommendations? For that matter does anyone have one for sale?

Stewart,

The idea has already been tried. Back about 15 or 20 years the Dutch instituted a license class for beginners. It consisted of about 5 frequencies in the two meter band. Licenses required only a simple test. No code. It was hoped that these Novices would upgrade and become regular licensees. As for as I know none ever did. The service still exists, I believe.

If you want to have youngsters or oldsters learn about radio the best way is the old Novice license. % wpm code, a simple theory test, and a one or two year limit within which they HAVE to upgrade!

Stewart,

The Netherlands implemented a license class very close to what you propose back about 1985 or so. A communicators license intended to bring the Citizens Band under control. About 5 frequencies were set aside in the two meter band for users. A ham license was granted with no code and only a simple theory test, about adequate to determine if the on light was on! People flocked to get in on the simple ham license. The government hoped if they were really interested they would upgrade, and if they weren't they could still take advantage of the thrill of communication and not bother the others. Holland requires evidence of a ham license before you can buy a ham radio,

The result? Almost no upgrades. Those who got into it stayed there.
IS that what you want for our kids?

> follow either convention.

Just a follow up to my previous post: LSB has often been used on MFSK below 10 MHZ (i.e. on 40m and 80m). However, ZL1BPU and IZ8BLY are now recommending the use of USB on all bands. To quote from Murray's MFSK web site:

"MFSK is sideband dependent, so the signal MUST be transmitted using the correct sideband. All MFSK operation is on USB, i.e. the idle tone is always the lowest frequency tone. (Note - during the development phase LSB was suggested for lower bands - forget it!) In this document and in all references to MFSK8/16 frequencies are quoted as the Idle Carrier Frequency (the lowest audio tone)."

-----BEGIN PGP SIGNED MESSAGE-----

hi...

I am looking for description,where to find the
discriminator output in the ALINCO DR-599.

I want to do 9k6 Packetradio and so I need the
discriminator output for the VHF and UHF part.

Many thanks in advance...

DG6SDB from Germany....

The information you had access to may have been stale, and never was entirely accurate.
The class-D license did in fact give you 6 channels. You had to upgrade within two years. THe upgrade requirement was later dropped.
After a short while the examination level was graded up quite considerably.
The license class was changed accordingly and now gives you a CW subband, an SSB subband and an FM subband on 2 meters and on 70 centimeters.
The D-callsigns were assigned alphabetically, starting with pd0aab, then aac, aad etc.
If you look in the callbook, you will notice that there are not many left over. Many of the "old" names are now found under the A or C class entries nowl
To recap: Dutch A-class is "everything" (hf, vhf and up, all modes) and requires morse code and electronics theory. C-class is VHF and up, all modes, requires same theory but no morse code. N-class replaces D-class (N for Novice) and requires limited theory, gives acces to Novice subbands on 2m and 70cm.
No-code on HF has never existed in Holland, but we all know the rumours.. just have to see what happens now.

have a good one,

Rudolf

The Gramophone carried a review of this �300 tuner. This is considerably cheaper than previous digital tuners. Has anybody had any experience of this model?

Also, I don't know much about digital radio reception. . I use a FUBA roof-mounted aerial with a Stolle rotator so I have good analogue reception, with a choice of three transmitters. Is a strong analogue signal likely to have a negative impact on digital reception? With digital TV, a too strong analogue signal can severely degrade the quality of the digital picture. Is this also true of radio?

Thanks
Mike

Hello,

maybe you spotted an SSTV (Slowscan TV) signal having 1500 Hz for black
pixels and 2300 Hz for white pixels (sort of).

I've had one here on test since just before Christmas.  I think it's
excellent, and given the current state of the DAB market, great value
for money.

> Also, I don't know much about digital radio reception. . I use a FUBA

I'm using the "wet-string" aerial supplied with the kit.  :-)

Very much doubt it, if my (limited) technical knowledge of the subject
is anywhere near accurate.  If you're near a transmitter, or
transmitters (multipath reception is essentially no problem with DAB)
you should be able to tune in a full-quality signal with a wire
coathanger.  In fringe areas you may need a band III type room, loft or
roof aerial.

Need help - I can't get KAM emulation working with MMTTY.

DETAILS:

The excellent design of MMTTY has provided for the use of it's RTTY decoder algorithms as an external modem. Two modem types are provided for in the stock MMTTY - the KAM and a TNC241.

I have MMTTY running OK and am trying to use its KAM emulation on a second computer while the first computer is running WriteLog. I have the computers connected properly, and can read the MMTTY's KAM ack signals on a copy of Hyperterminal running on the WL computer, so I know my cable, both ports, and MMTTY are working OK.

When I tell WL that a KAM is on this port, it tries to initialize the KAM and put the KAM in "host" mode. WL fails at this and then cannot seem to communicate with the "KAM" at all.

Perhaps MMTTY's KAM emulation is only partial? How can I get it working?

Sure would be nice if MMTTY also provided a "dumb terminal" mode which simply passes along the baudot.

Jerry W4UK

Paul -

Many amateurs use I-Phone (made by VocalTec) to access repeaters over
the internet. Personally, I have a repeater in Sioux City, Iowa that I
access
over the internet from Oregon almost daily. The locals usually don't
realize that I am not local on the UHF repeater RF coverage.

Paul Lantz <plantz@onlink.net> wrote

Mike

The strength of your analogue signal should have no effect on your DAB reception.

The problem with television is that analogue and digital tv are close together in the same frequency band.   DAB is in Band3 (230 MHz approx, whereas FM is in Band 2 (100 MHz approx) i.e. completely different frequency bands. So no problem.

Your Band2 FM antenna will not be tuned for DAB in Band 3.   An outdoor antenna is usually not needed for DAB. DAB can work with a very simple wire indoor antenna.

Regards

Graham Moreton

hi to all people in this newgroup!
i have one question to you.
could you give some links regarding packet radio systems?
i would like to make one for myself.
thx

Amateur SSTV is not legal on this band by US hams.  I just went up for a
listen. It does sound like a RTTY type station.  I didn't try to decode
it, but very little RTTY is sent in the clear anymore from my casual
observations.  Satellite technology has taken a lot of old commercial
RTTY off of short-wave.
Pete

Hello all.

I am having trouble with my Samsung dot-matrix sp2412 printer. I was
downloading today on one of the PSK software when halfway through the

printing the paper got into a mess and I had to close all down. After fixing it, I went to the page where the trouble had started and tried printing again. It was very disappointing to see the printing go back to page 1 again of 90 sheets.

If someone could help I'd be really pleased.

Jim (ZL2BMH)

Seeing that it is within the 30 meter amateur radio band, I felt
this would be an appropriate forum. I guess either everyone else
already knows what it is or doesn't care!

Correct ... it was NOT SSTV ... I know the difference. It's
definately RTTY with a 850hz shift (aren't waterfall displays
nifty?). I've tried upper and lower SSB, the signal is VERY
strongly received here in AZ, but I have not been able to
decode the signal.

I'll take another look tonite and see if it's there again.

Can't speak for everyone else, but the signal analysis function of the
PK-232 can't really make up its mind about it, so I've always assumed
it is commercial or military encrypted or encoded in some manner that
the usual demodulators can't deal with.

Hi to all:

We are making a Radionavigational and Radiocommunication Museum at the
Facultad de Ciencias N�uticas at C�diz University.

We have a group of radiosets without historical references and we desire joint

it near the radio apparatus for info to the visitors.

Could you help us?. I think that those sets could be of the 60's decade.

Navigation Echo-Sounder type 846V V M
Directional radiotelephone Trevin T15
Radiotelephone MF Sailor T122
Decca Navigator MK12
Radiotelephone and Consol receiver Phillips 27RR50
Weather fax receiver Koden (with fix channel-switches)
Radiotelegraphic Autoalarm 500 kHz AA4.
MF Radiotelephone MTR102ZA

And the "new" sets:
VHF Radiobeacon receiver Koden KS5150
Echo sounder Seafarer 4
Graphic and echo sounder Viking Marine DR200

All help will be wellcome and the helpers will be announced at the explanation

of each set.

Please contact directly with me.

Best regards.

Carlos Mascare�as

I just got some other email saying the same thing basically.
30 meters is shared use and this is probably a gov station.

I've always just used cw on this band until playing with
the digital soundcard modes recently, so I just never noticed it.

Thanks for the response!

```

There are several problems with this proposal:

1. As a 15 year old, I can tell you that the most interesting thing of ham radio is DX, not short range VHF communications.
2. This proposal would isolate the newbies, if there are not any other recent "Colt" licensees around, they would quickly grow bored and would not upgrade. Chatting with people who have been around a while and who are talking about the Walk-a-Thon or picnic the local club is involved in or the great conditions on the HF bands today.
3. The Tech license is already extremely easy to get. I got my Tech just over a year ago and it took about a week to study enough to pass the test, and that was with 55 questions on two tests, not 35.

While I agree more young people are needed in the hobby, the problem is not
the license structure, which I believe to be perfect, it is the PR
deficencies.

> class in the Amateur Radio Service - REV A
>
>
> In the late 1980's and early 1990's when the current Amateur Radio Service Technician Class license was conceived and implemented, it was an appropriate alternate introductory license class. However, due to the recent elimination of the Novice Class license, and as a result of improving technology; the Technician Class license no longer serves well as the only introductory license, as it is doing poorly in drawing young members into the Service. As a result of license restructuring, it is now actually harder for young people to obtain an Amateur license than it was before restructuring.
>
> In this critical era of global competition, especially in the wireless communications arena, it is essential that we provide a means for properly educating our young people in RF communications operation and theory.
>
> Today, technologies like the Family Radio Service, high-speed telephone & cable modems, the Internet, and inexpensive cellular telephones, have overshadowed the privileges of the Amateur Radio Service, and made the requirements for young beginners to obtain a Technician Class license out of date. Additionally, the Technician Class license has now evolved into a beginning and ending point for most modern day Amateurs, who are mostly interested in VHF/UHF communications, rather than HF communications. Incentive licensing has virtually been eliminated.
>
> The need for a Service dedicated to the goal of teaching young radio users proper radio operation techniques and etiquette can clearly be seen in the disarray present on the 11 meter Citizen's Band Service frequencies. The fact is, the Citizen's Band has become the defacto introductory service for young people just beginning to learn to experiment with radio; yet the Citizen's Band is a very poor environment for young people to be learning in.
>
> Therefore, it is recommended that a new "Colt Class" license be added to the Amateur Radio Service expressly to encourage young individuals to enter the Amateur Radio Service to improve their understanding of RF communications theory, provide a healthy learning environment, and encourage radio experimentation.
>
> On the 70cm UHF band, Colt licensees would be restricted to voice communications on 5 simplex-only 20khz-spaced channels on 446.00, 446.02, 446.04, 446.06, and 446.08 Mhz; and digital communications up to 19,200bps on 1 simplex-only 60khz bandwidth channel on 446.14Mhz.

What about this as a proposal. Leave everything as it is as far as licenses
are concerned. But, then eliminate the rule that you can't charge money
for testing people. And, then work to get the FCC to cut a deal
to allow, for example, Radio Shack and ham radio stores to give ham radio
license tests right in the store -- and set up a computer system to give call
signs
right on the spot. Then, the stores could make a little money giving the test.
And, might pick up some extra sales from new hams.

The money they charge is for all the expenses of testing - there isn't a mandatory charge

I don't understand the fuss about this signal. The HF band is full of signals that are not intended for everyone to receive. The 10 MHz band is at least in Region 1 a shared allocation in which the fixed service is the primary user and radio amateurs are secondary users.

So what you are hearing is most likely some non-amateur station communicating with an other non-amateur station.

You could even have the test on the computer, the computer than could grade your test(s) and as you pointed out issue your call sign on the spot. Then the computer could pop up what the store had in your price range. You would then press your selections and walk to the front of the store, pickup your license and equipment and head home ready to operate.

We could do the same thing from Mall kiosks to attract young people. This could be coupled with playstation rentals, beepers, and cell phones. A one stop communications and entertainment kiosk. ARRL could create a Sony playstation and gameboy cartridge to teach amateur radio, along with an amateur radio adventure that would require simulated contacts with DX countries to obtain clues to finish the game. Wow! I wish I had thought of that. The only problem is getting it by the old elitist hams that think you should learn a bunch of code and radio nonsense to gain what is rightfully yours because you want it..

I don't like this idea very much. The part that worries me is as you say, they "might pick up some extra sales from new hams". Without accusing any store or anyone of dishonesty, I think it's a bad idea for the test giver to have such an immediate and direct financial incentive to have the examinee pass.

Money makes the world go-round. Methinks. And if you want to get more young people in the hobby, I think you need the kind of marketing muscle that Radio Shack can provide. And, I think the fraud issue here is over-estimated. There's been fraud in the testing system as it is. If you had big companies involved, who had lawyers, they could snap the whip with the employees. And, they'd be better positioned to enforce standards, than random individuals. I think.

Just enact some fines for cheating. Hire a few people to go around, and masquerade as applicants to keep the system clean. And, open an office, that would handle reports of fraud, and then investigate as a criminal matter. It'd probably be cleaner than the current setup.

Maybe a 15 year old can explain to the rest how to stop posting to the
rec.radio.CB group.

I would suggest that you rethink that tact.

Did I miss out on the announcement where you had been appointed Usenet
enforcer?

net protocol does not allow me to alter the headers on a thread I did not
start. As I am not the author of this thread, you are addressing the wrong
party.

I also note that your message was sent to all the newsgroups as well.

How much processor power? Which OS? While stories about of
people running PSK31 on Z80s and 4004s, a Pentium (say, P133)
is really the minimum requirement.

If the sound card is supported by the OS (Linux or Windows),
it doesn't matter what kind it is.

Marketing muscle? Is this from the same group of drooling no-loads I've
encountered in almost every RadShack I've entered over the past several
decades? These folks panic when a customer refuses to provide his name
and address.

The people who are Radio Shack's customers seem to be from several
distinct groups: a) those who need a part in a hurry and can't wait for

delivery from a "1-800" house (I generally fall into this group), b) those who don't care about price, c) those who don't care about quality and d) those who are waiting for a spouse to finish shopping at the mall.

I don't think we need individuals who are incapable of identifying an electronic component administering amateur license testing.

For what ever reason this cross posting continues to be a problem usually stemming from the ham groups. You surely have control to which NG you direct your response to. It figures you would follow everyone off the cliff to adhere to protocol. Do you believe that anyone who is only interested in CB gives a rats @$$ about some new Brownie license to use a radio? This NG is CB no license, no policy etc. So why even post it here?

If I have to nominate myself as the enforcer of this group so be it others will support the cause. If the amateur NG would like all of the CB posts crossed to their NG it can begin immediately. You see it is like one guy turns on an amp then another then another and pretty soon the whole band is unusable. Is it time to see who's is bigger? Or can this just end and everyone take their posts where they belong?

Since I don't know the origins and really don't care to waste time researching I am posting back to all the groups so that no one can later say what happened and why. This thread being crossed to the CB group can be stopped if you want to. Or you can get prepared to read many more posts that don't pertain to your groups.

You are talking about "apples" and "oranges". The RigBlaster is a
simple Tx audio and PTT interface between your sound card and the rig.
The MFJ-1278B is a controller that does all the decoding and sends
data to a terminal program on the computer - no sound card used.

My suggestion would be get active in MARS first and find out exactly what their requirements are. My guess is that they are using Pactor so the 1278 might work. Sound card programs (except for some old DOS programs) don't do Pactor. You might also find that MARS uses some special software which may limit what hardware you can use to interface to it.

There's a schematic of the TAPR TNC-2 available from TAPR.
It is nearly identical, except that it doesn't have the tuning indicator.

ftp://tapr.org/software_lib/tnc/tnc2sch.pdf

Well that's what I was hoping ... but I have not been able to find
any info on the minimum rev needed for pactor. There does not appear to
be a PACTO command anywhere, just amtor mode commands.

There is a menu you can bring up with the SET command that makes
for simple dumb terminal setup for the mode desired ... no PACTOR
there. I was browsing thru the MFJ online manuals today, and see that
ver 3.7 is the latest release of firmware. Nothing is mentioned in the
2 manuals I have, or the addendums about PACTOR either.

Perhaps someone can confirm the rev they've been using. I suspect this
unit is just outside the needed release :(

Duffy,

We're working on finishing up MultiComm Host/Multimode. Actually, we were at MFJ giving training on it to their sales and support people today.

The big hold up is the SSTV interface. Once we get that finished, we'll release it in Preview. Like Pacterm '98 and PKTerm '99, it will support the 1278 keying circut for PSK-31 and MFSK-16..The other HF modes work now.. even though it's only in terminal mode. (the 1278 doesn't support BLP host mode with the HF modes, just with the Packet modes).

After doing a search thru the archives of dejanews.com, it
appears that the firmware release of 3.4 is too old to
support packet and this old 1278 requires the MFJ-56A upgrade
($69.95).

Are there any voice mode links that use the internet, e.g. a 2m repeater
that is accessed for voice?

I dont have access to a repeater where I live -- curious to see if other
remote amateurs have done anything to use internet to get voice access to
repeaters, etc.

All of the info I have seen has been about internet digital links or
satellite based voice links (eg IPARN).

I did try playing around with 'netmeeting' -- though I hooked up hooked
a mike, and tried clicking on a few buttons, and the first
thing I saw was a guy pulling out his penis and masturbating. The
technology works pretty good, from a technology perspective -- at least
with my DSL line here. But, it seems like most of the net video
conferencing stuff is used for sex. I have since discovered. Ahem.

I have seen several people on PSK31 mention that they are running
"Hamscope". Unfortunately, I have been unable to find it through searching,
and I have been unable to catch one of the people on PSK31 to ask them where
they got it. Does anyone know where to find Hamscope?

-David N9KT

Dear Tnos user,
Have used Tnos 2.30 successfully for years (slattach to a PK232)
But now I am using a new Mandrake 72. my tnos comes up as usual on xterm (terminal)
but then suddenly the prompt begins to tick and multiply like
:::::::::::
I don't know what is interfering or why the tnos doesn'like the xterm

startup nos file :

export Term=xterm

I think here I need some modification ?????

Any help, or if you know anybody who runs Tnos under Linux
I am absolutely frustrated. because I can kick up the PK232 DSP only
with slattach
and a furious "tip ax0"-- cmd: KIss on"

Any , any help is very appreciated- Thank you

vy 73 de john oe5fol

Bob,
Thanks for the info.  I'll take a look at it.

Ah, but will the European Version have "Skycommand" ? The TH-D7E does'nt
have a Menu for Skycommand Functions so am I right in assuming that all of
Europe will miss out this function on the TS-2000????

Why would it replace sstv?
I can't see any reason why you couldn't use whatever software you
have now (to use a webcam on the internet) on packet. If it will work
on a lan then it should work on packet.

Why settle for still images when you can use your webcam for full motion, but slow frame rate, video?

I wanted to buy a webcam thingo a while back, but I wasn't allowed to.

Shane..

This assumes the througput of your packet link is comparable to that of a
state-of-the-art telephone modem. There you have your reason.

Rob

Hmmmmmmmmmmmm.  Most people don't consider cybersex as "good technology."
However, it does prove that the technology works well.

It works fine over packet ...
... just as one would expect.

You can do a bit better than sstv over a good link.

>2 manuals I have, or the addendums about PACTOR either.

MFJ sold an upgrade for machines like yours with a daughterboard to plug in, making it the almost equivalent of a 1278B (one key difference was that your 1278 most likely won't handle a terminal speed faster than 9600 baud, while the later versions would handle 19,200 over the serial port connection). I've never been quite sure if the MFJ was a good investment or not. It did offer lots of functions but for example on Pactor, its implementation was not particularly good, it worked, but needed a much stronger signal, and sadly even with a 9600 baud modem, it's still slow today. For keyboard to keyboard work, it also doesn't handle newer modes like PSK31, or MMTTY or any of the newer mostly soundcard dependent modes, and its rtty implementation while functional wasn't the bet either. As for 300 baud packet, the less said the better on almost any implemenation, packet just isn't suitable for HF it appears.

Some clarifications may help:

RITTY is the name of a DOS sound-card RTTY program written by K6STI. You can learn more about it at http://www.eham.net/reviews/detail/235. The author expects to be paid for his time and effort, so it's not surprising that you didn't find a download site. You may be able to order a copy by contacting him directly (you can look up his address at http://www.buck.com).

The acronym MTTY mentioned above could mean several things. One of them is a "minimum-shift" (22.7 Hz) RTTY mode supported by UT2UZ's MixW32 software (http://users.nais.com/~jaffejim/mixwpage.htm). However, it may instead have been intended to refer to a popular free Windows sound-card RTTY program called MMTTY. You can download MMTTY from http://www.geocities.com/mmtty_rtty/index.html.

Very nice program too, I use it a lot. I had heard that RITTY supports ARQ
modes, hence my interest.

Ok,
I'm completely new to packet, I assume by the comments that packet has a
data link defined for tcp/ip then? If so what do I need to take a computer
serial or modem output to link it with a transmitter? It would make sense
that there would be an interface device that would key a transmitter and do
the modulation. I guess there would be something comperable for the receive
side or a combo for a transciever? Is there a website that describes the
equipment?

Thanks,
Phil Moore

If you use Windows, search the web for sv2agw.  This software can work
with sound cards or other cheap-ish modems, that then connect to your radio.
It does TCP/IP, but you have to pay a cheap registration fee for that.

Perhaps you need to start at the beginning.
I just went to google and searched for "guide to packet radio" and got -
Searched the web for "guide to packet radio".   Results 1 - 10 of about 34.
Search took 0.85 seconds.
A quick look through that lot should bring you up to speed.
There were also some good magazine articals on packet written 10 to 15 years ago when packet
was getting into full swing.

Cathryn mentioned AGW which gets good revues. I use Flex32 which is very good for tcpip, but
doesn't have a lot of support for normal ax25 (packet) as yet. Once set up for tcpip they can be
treated as a LAN as far as your internet software goes. What speed you use is up to you (and
the people you network with), but you can't expect to get normal internet performance on a
1200bd packet link. I have a web page with a rough idea of what I've done here at
http://www.qsl.net/vk3bvp/ethrax25.htm I'm not a web page designer or a writer :-)

There is also the more traditional tcpip packet software and I know that two of the people that
have contributed to this thread have written their own variants on that. These normally have
NOS or NET in their name.

Have fun.

Ahhh, the *real* story comes out ;)

For that, I'd recommend giving xpcom a try ...

http://www.goodnet.com/~gjohnson/

You did not mention what kind of multi-mode controller you are using,
or if you have a desire to operate in a dos or windows (or linux?)
environment. From my recent searches for pactor support it seems
most programs support Kantronics, AEA, and sometimes MFJ equipment.
Oh, and then there is that $other$ company SCS ;)

Good luck!

Brad,

I have no idea. I updated it the first year since MFJ gave out update
certificates for a new ROM several years ago. I have not seen any
information on an upgrade in some time so I suspect it is their latest
version.

Duffy

I need help to find the pin configuration on the mic connecter on the HTX-252 . The Radio Shake sit is no help. I have searched for other packet pages and I have found diagrams for other Radio Shack 2 meter transceivers but not for the HTX-252.

Thank you
Don in Jamestown NY.

Radio Shack does not support modifications to their new radios.

Need to sit down with your scope and check the pins.

I suppose this is funny because it is such an old joke,
but I'm wondering if anyone who actually uses it in a
signature block, isn't about as brainless as the redneck
whose bumper-sticker proclaims that his kid beat up your
honor student.

*NOS under DOS/Windows pretty well does this as well as act as a
hardware interface and server/client if required. It's a do everything
package if set up that way.

I never managed to get it to work very well.
Under DOS/Windows I do it with rewrite, alias and smtp<>nntp mapping.
Fairly simple once it's understood. Maybe mailgw is too once you
get to that stage.

>

>

NNTP is already a part of *NOS.
Or as I'm doing, use an internet nntp server on packet.
The one I'm using has smtp<>nntp and back.
Pretty well all the server and client internet software (windows and
linux) will run on packet, so there's no need to redo it unless you
want to. I'm running servers (and clients) written for the internet for
nntp, smtp, pop3, ftp and http (and other stuff) on packet.

If I ever work out how to compile JNOS, I'll do up my own copy
and maybe use it instead of some of the internet servers I'm using
now. But they do offer a lot and cover protocols that *NOS doesn't.

I think that in the long term ax25 BBS's will have to become more
like internet software or at least compliant with it so that the
interface between them becomes seamless. Or at least that's
what I'm hoping will happen.

For now I'll enjoy playing with all the software already available.

Actually, old chap, a sense of humor is widely considered to be a sign of intelligence. How do you suppose your above humorless comment fares when such a standard is applied to it, and to you?

Hank,

I think that one of the biggest problems is that Amateur Packet tries to solve problems for which it is not best fitted. If you compare the Internet and Packet, you'll see significant similarities, and to the users, they are almost identical. But the difference is in the infrastructure. The Internet is a high-speed, point-to-point network where Packet is slow speed, relay network. e.g. If I send a message from one end of the continent to another on the Internet, the two application level end-stations talk directly to each other and message delay is in an order of seconds. On packet, you normally talk through a couple of relay points and really don't have any traceability of message delivery.

As such, broadcast messages work significantly better on Packet than personal messages. And broadcast works better on the Internet only because of the faster speeds. When I factor this information in, as well as the normal garbage level of broadcast messages, I start to realize that the Packet network does not do a great job of providing a messaging backbone. Too little coordination, too little throughput, too little everything to do a good job. So after years of experience, I realize that backbone is not a place where Packet does a great job.

So where does packet do a great job? I think that we'll all agree that Packet's ability is best in situations where the wired network has failed. We can quickly deploy packet, either a completely new network, or using portions of an existing network augmented by additional portable stations.

So to best implement a solution, I see that by creating a network where the Internet provides backbone capabilities and Packet provides drop-off into disaster areas we get good solutions using the best of both networks. The reliability comes from having multiple packet stations connected to multiple parts of the Internet, as well as geographically spread to provide full coverage of problem areas.

As to the infrastructure, using existing NNTP servers could be advantageous, their delivery is not extremely reliable (2GB of pictures each day is a hefty load) and we should probably look at using some sort of alternative, even if it's a dedicated NNTP network. SMTP should be used for message delivery on the Internet, because that's how most of your recipients will be addressed. And that brings us to the biggest problem, the inability for the standard packet BBS to use a SMTP type address.

But the biggest obstacle really isn't technical, it's creating a need for the network. For people to use a network, it needs to contain information that is of interest. Or to provide a service that isn't available any where else. The Internet has pretty well taken over what the packet network was used for in the 80's and 90's. Sending personal messages, bulletins, or even NTS messages just isn't efficient anymore, when compared to the Internet. Even NTS and MARS traffic in general have been replaced by email. Who needs a radio operator on a boat at sea to send a message when they've got Internet email?

This isn't just a Packet problem. This is a problem effecting Amateur Radio as a whole. About the only thing that is separating the Internet from Amateur Radio is that Amateur Radio is where you go to talk to old farts. (Although many of the old farts are now available on the Internet!)

I don't believe that recreating the packet network of the 80's and 90's, even with better delivery is the answer to the problem. It's actually an answer trying to find a problem that doesn't exist!

This is only true when you study the Internet from the outside.
In reality it is structured exactly the same as the packet radio network:
a collection of point-to-point links connected by routers.
You don't talk directly to an endpoint on the Internet, each of your
packets travels through several routers just like it does when you connect
on a NET/ROM or other node. It only is faster so you don't notice.

Mail messages don't usually travel in one hop either, but you only notice
when you closely examine the headers. Usually they will travel from the
user's system towards a relay machine on the boundary between the trusted
environment of the user and the Internet, then towards a relay at the
boundary between the destination user and the Internet, and then onwards
to the machine of the destination user.

This has just the same reliability and traceability level of packet radio.

You will find that bulletin messages (Usenet news) take even more hops.

Rob

Yeah, every time I try to build mailgw, it bugs out on an error that I've forgotten and fix again each time. And, I forget what it is, but it's a dumb bug. And, on top of that, innd, comes up okay when I install it from the rpm. But, if things start going bad, fixing inn is tough -- err, I'm not a nntp guru.

Anyway, I'm more comfortable with Linux than NOS. So, that's
my deal.

Dave,

Have you ever thought of having the option for visitors to your web
page to be able to bypass all the bells and whistles?  I tried three
times to access it and my browser just froze up each time.. Had to
hard boot to get out.

For those of us that have rather slow connect speeds having all that
MIDI stuff is just a major pain when trying to get information.

I guess my homicide sense of humor isn't what it should be.

The message <RO746.5480$wk.7647578@news1.mia>
  from  <news@global1trading.com> contains these words:

> SpyPen the digital FunCam is the beginning of internet and digital
> photography fun. As small as a candybar (55 gr.) SpyPen fits into any pocket.
> Take pictures and videos (picture sequences) in the most secret hiding
> places. Meet your best friends online via video conferencing and share your
```

> favorite pics through email. Create 360=B0 panoramas for an amazing 3D
> touch on your web site. SpyPen the real 3 in 1 FunCam comes with great
> photo and video software! FunNet, FunPics, FunCam

> Visit us at http://www.global1trading.com

Yes, they're cute. But anyone contemplating buying one might like to look first at the comments on the SUBMINI-L list on AOL, where the general opinion seems to be that cuteness is their only virtue, and their image-gathering abilities are virtually nil.

Now if GlobalTrading had seen fit to promote on this site the three different sizes of portable solar cell panels that are also shown on the site
above, there
might have been a little more sense in it ...

Bob, G8IYK

You will find this kind of software via
http://www.radio-portal.org/index.cat.html

This search engine especially for radio amateurs and short wave listeners
let you search within categories; "Software" and "Digital Broadcasting"
might be the
ones of interest to you.

Regards,
Willi

Muscle Shoals, Alabama. January 5, 2001: Creative Services Software has announced that they have come to an agreement with Murray Greenman, ZL1BPU and Nino Porcino, IZ8BLY to add the new MSFK-16 digital mode to the CSS product line.

The popular TNC programs, written in C++, have been available since November 1997.

Company President Rick Ruhl, W4PC said, "Like our PSK-31 interface, the MFSK-16 interface will be fully functional in our freely downloadable demo version. Our value added feature for the MFSK-16 will have the ability to use the TNC's keying circuit or the RTS line off the TNCs serial port for keying the radio. This saves you a serial port and allows you to move between the sound card's modes (PSK-31 and MSFK-16) and the TNC's modes (CW, RTTY, Etc) with the click of a mouse.

The program runs under Windows 95/98/Me and Windows NT/2000. It is a true 32-bit Windows application, designed using the Windows Style Guidelines available from Microsoft.

"Many ham application programmers are not aware of the Windows Style Guidelines. As an example, top-level menus are required to have a drop down menu. We adhere to the Style Guidelines since that is what makes the interface consistent between Windows programs. CSS follows them as closely as possible, and has been writing Windows programs since Windows 1.01 in 1985. " Ruhl said.

PacTerm '98, PKTerm '99   They are available directly from Creative Services Software or your favorite dealer. You can also download the program in demo mode from the CSS web site.
Creative Services Software is at http://www.cssincorp.com.

Windows, Windows 95, Windows 98, Windows NT and Windows 2000 are Registered Trademarks of Microsoft Corporation.

Internet - certainly.

Two little pointers plucked from the ether follow.

73, G.

To: packet@gbr
Subject: Email dilution

I've noticed a worrying trend of late......

You put out a packet bulletin, and get a flood of internet emails in reply.

You reply to those emails by packet, but they still reply by email .....

And:

Subject: Re: Email dilution
To : PACKET@GBR

I have to agree about the e-mail replies instead of on packet. I've had a few myself..... I can recommend the e-groups web site and it's various radio orientated areas where you will find many of us.

How much stuff does that list generate?  I avoid mailing lists like a plague
because I'd get 50 bazillion emails a week from others and ended up
cancelling out of them.

 I get SpaceNews, JSR (Johnathan's Space Report), and AMSAT. It's quite
nice. Just the right amount of traffic. Lots of good info. Between those
lists, NASA-TV, SatTrack and Dr. Kelso's celestrak ftp site, I'm a happy
camper! And AMSAT sends these short informative bulletins when there's
action on AO-40.
Go for it.

For sale: Two AEA PK-96 dual speed TNC's.
Does 1200 and 9600 baud on the same radio.
One is 100% and the other hangs on initialization.
Includes 2 copies of the manual.

$140 for both shipped to lower 48. For more info send email to
 ZZZjim_cronin@juno.comZZZ (remove leading and trailing ZZZ).

 Thanks and 73,
 Jim

PK term looks good - now if there was an up date to accomodate FAX and ACARS from within the program (my PK900 will do both) and use dual ports, would be just great.. (Thought I'd bug you again, Rick)

Bill, N3DDY

"Rick Ruhl" <ricker@cssincorp.com> wrote in message
news:qfn56.875$4Z.68430@news2.atl...
Muscle Shoals, Alabama. January 5, 2001: Creative Services Software has announced that they have come to an agreement with Murray Greenman, ZL1BPU and Nino Porcino, IZ8BLY to add the new MSFK-16 digital mode to the CSS product line.

The popular TNC programs, written in C++, have been available since November 1997.

Company President Rick Ruhl, W4PC said, "Like our PSK-31 interface, the MFSK-16 interface will be fully functional in our freely downloadable demo version. Our value added feature for the MFSK-16 will have the ability to use the TNC's keying circuit or the RTS line off the TNCs serial port for keying the radio. This saves you a serial port and allows you to move between the sound card's modes (PSK-31 and MSFK-16) and the TNC's modes (CW, RTTY, Etc) with the click of a mouse.

The program runs under Windows 95/98/Me and Windows NT/2000. It is a true 32-bit Windows application, designed using the Windows Style Guidelines available from Microsoft.

"Many ham application programmers are not aware of the Windows Style Guidelines. As an example, top-level menus are required to have a drop down menu. We adhere to the Style Guidelines since that is what makes the interface consistent between Windows programs. CSS follows them as closely as possible, and has been writing Windows programs since Windows 1.01 in 1985. " Ruhl said.

PacTerm '98, PKTerm '99 They are available directly from Creative Services Software or your favorite dealer. You can also download the program in demo mode from the CSS web site.
Creative Services Software is at http://www.cssincorp.com.

Windows, Windows 95, Windows 98, Windows NT and Windows 2000 are Registered Trademarks of Microsoft Corporation.

Well ... I mean more or less is it good for anything? ;)

I picked one up a while back (used) figuring it would be a relatively inexpensive way to check out some of the HF digital modes. In particular, I want to play around with RTTY and PACTOR 1. I've found out about and tried MMTTY ... excellent sound card program for RTTY, BTW.

Although, I have used this MFJ on VHF packet without trouble, it has been a pain to find any decent software for it for other modes. The best I've been able to come up with is XPCOMM. But I have another problem ... even just running in a standard terminal mode, I have been unable to get it to properly decode RTTY, much less PACTOR. From my experience with the MMTTY program I know I have the SSB rig setup properly ... LSB and all that, but when I try to tune in a signal via the MFJ, all I get is nonsense characters. I suppose I can run thru the calibration routines for the 3.4 firmware that this unit has, but I figure if it's working ok for vhf packet they are probably ok.

Somewhere along the line I had gotten the impression that the 1278 was an ok rig for these modes ... or is it a joke?

BTW ... is there a good Windows and sound card based program for PACTOR in existence at all?

```

You've got something wrong. The MFJ-1278 works fine for Pactor and
RTTY.

Thanks for the confirmation Bob ;) Yeah, I just finished a complete recal of the unit, and now can decode the many sigs going on right now with the roundup. Just made a contact moments ago, so the xmit side is working too. Several of the adjustments seemed to be off 10's of HZ, so I don't know if some had played diddle stick in the past or not ... as I said before it seemed to work ok on vhf packet.

Now I just have to wait another 30 minutes for this contest to end, so I can look around for a PACTOR station ;)

Bill,

We have a Wefax program for the PK-900 (Wefax '99) and it works great with the two color fax mode that's supported in the PK-900. (Basicly, it's a Windows version of the old PKFax Dos version). It's included in our Digital Trio package or can be purchased separately.

I never have been able to find any docs on the ACARS format with the PK-900. The DOS based ACARS program that AEA had wasn't owned by them, and so Timewave couldn't provide us with that for reference, like they did with the PkFax stuff.

Rick - W4PC

The TS-2000 reports are looking good - heck - I'd even say JUICY! I
just GOTTA get me one of those!! Some people say it's ugly, but I don't
care what it looks like as long as it works.

It don't matter what she looks like, only what she cooks like...

Bob, may I ask what release of firmware on the 1278 you've had
experience with. I have 3.4 (7/30/90) and I suspect it is too old
to suport pactor (well XPCOM PACOTR mode commands generate a lot
of ?EH responses!).

My 1278 kicked the bucket a couple of years ago. I replaced it with

a PK-232MBX (with pactor upgrade) and it kicked recently! They ran for
about a year or so each. I believe there's some hope of repair and upgrade
at Timewave for the PK-232 but does anyone know of a repair service
for the 1278? If these aren't worth fixing, what's the best/latest thing
to replace them with?

Well, after some off-post email discussions on this subject, I'm
leaning towards the Kantronics KAM+, for what it's worth. Seems to
be better support for the product, and I've had good acclaim from
pactor-1 users.

Hello,

I am looking for some CAT software for my FT-847. I have come across the "SuperControl" and "TRX-Manager" software and am looking for others. Are there any "free" verisons out there that you would recommend? Any you would suggest I avoid?

Thanks you and 73!

It's been a long time since I've used the 1278 so I couldn't tell you what version ROM it had. You could run Windows HyperTerm and send the 1278 some commands manually to see if it has Pactor and is set up correctly. What you might have is an issue between XPCOM and the ROM version. It's easier to troubleshoot things if you run a "dumb terminal" program like HyperTerm so you can acutally see what is happening.

Mine works great on all modes but SSTV. It's garbage for that mode. Works great on Pactor and Packet which I usually work and some RTTY. I use the MFJ software, not great, but functional. Logger has an interface for the 1278, and it is pretty good for free software.

Shoot, I'd buy the software in a heartbeat if they had something that would FULLY support the MFJ 1278B. Come on guys, you can do it.

Hi Brad,

I have used the KAM PLUS, PK-900, SCS PTC II and DXP-38 on Pactor 1.

In my view, the KAM PLUS performs the worst of all the TNC's that I have used on Pactor 1. Too bad, the KAM PLUS works great on all the other modes like RTTY, AMTOR and packet!   In my view, you just can't beat the KAM PLUS for VHF and HF packet. It has so many great features! Almost all the Hams that are still on HF packet use the KAM PLUS.

When the signals are strong and stable, the KAM PLUS seems to work okay on Pactor 1. But with weak or fading signals, there are a lot of retries. I have heard some speculate that KANTRONICS did not do a good job implementing the phase correction routines in the KAM for Pactor 1. Maybe -- I do not know.

In my view, the DXP-38 works better than the KAM PLUS in its so called "P-MODE". But occasionally, the link would drop all of the sudden for no apparent reason. There may be bugs in the firmware of the DXP-38.

The PK-900 works GREAT on PACTOR 1. Unlike the KAM, the PK-900 has a A/D chip for true hardware memory ARQ.   In my view, the PK-900 is probably the best AMERICAN made TNC for Pactor 1.

I have heard from Hams who have used both the PK-232 and KAM that the PK-232 works better than the KAM on Pactor 1. Perhaps, AEA did a better job at implementing Pactor 1 than KANTRONICS??

The SCS PTC II does the best job on Pactor 1 (and Pactor II) but you would expect that from the company who invented Pactor.

I do not hear that much Pactor 1 activity these days. But I hear more and more Pactor II activity. (Pactor II is truly an amazing mode). Personally, I would not spend too much money on a TNC for Pactor 1. Like AMTOR, PACTOR 1 is disappearing.

Other than the TOR modes, most of the other modes implemented in the KAM, PK-232 etc have now been implemented in FREE sound card programs using DSP! Many of these sound card programs perform better than the multimode controllers ever did. (e.g. I have heard Hams say that MMTTY for Windows performs better than most TNC's on RTTY. Best of all it is FREE!)

It should also be noted that a lot of Hams are using PSK31 and MFSK on the Ham bands. With the exception of PSK31 in the PTC II, none of these popular new modes have been implemented in the multimode controllers such as the KAM, PK-232, PK-900 etc. I do not even think it is technically possible. You need a DSP based modem for these new modes. So if you want to join in on the fun, you are going to have to hook up your sound card anyway!

A lot of Hams appear to be dumping their multimode controllers and TNC's on Ebay (and just using their sound card). If you want to still operate Pactor 1, I suggest you pick up a used multimode controller off Ebay or at a flea market! But don't be surprised if one day it becomes a museum piece.

73's
Rob

I need advice on purchasing the controller interface between
radio and computer.

I have the paperwork from Arizona to become a MARS station
and would like info on the best of all worlds for the hardware
and software to meet the military's needs at my end for data
transmissions to my station.

I looked at the MFJ-1278B and someone recommended the
RigBlaster, but it seemed limited.

Any ideas and any info on other interfaces would be greatly
appreciated.

I need maximum features for send and receive.

Does anyone have a schematic of the mfj-1274 tnc that they could email me? I'm trying to fix the clubs tnc and needless to say no documentation.

Any help would be greatly appreciated.

Hi,

I want to buy a PSION REVO or REVO PLUS
If there exists a way to have packet radio working on this palmtop, please
send me any information on :

- how to install software

- where to find software
- how to hook up a TNC
- witch tnc's will work
- what is possible

I've heard about psion and Packet, maybe the REVO is not right and I need
another model
So all info is welcome

Thanks a million !
Phil, ON4BAW

Congratulations to W8FDV and W3SHY they garner the Digital
Bozo of the week award for firing up right over the ARRL MFSK16
Digital run. How well did these old time experienced Extra Class
operators do? Well they wiped out W1AW and were perfect copy
so I'd say they hit the QRM right on the head. Congrats you two
clowns get to share Digital Bozo of the Week.

Try listening before transmitting old age and bad hearing don't
excuse this one guys.

I wasn't there. I support and am a member of, ARRL. However, I believe that I am correct that it is an announced policy of W1AW, when sending bulletins, not to listen before transmitting. While FCC has issued rulings which seem to say that this is legal, I still believe that it is a misguided and unwise policy. Accordingly, one wonders whether the fault in the instance noted above was that of the individual amateurs. (Don't ask me.)

I have used the original WinPSK for most of my PSK operating. However, when switching to the new dll version 2.0 the decoding seems to be rather poor. Also other PSK programs built on the DLL do not seem to decode as well either. I am not the only one that seems to have noticed this either. Anyone else run into this? Anyone have an explanation on why this may be ocurring?

Thanks,

Duffy - WB8NUT

Anyone have any ideas about how to operate an HF transceiver remotely over a phone line?

I know you can do this with a Kachina (at great expense) or in a simple way with touch-tone pads etc but what about other rigs such as Yaesu/Icom/Kenwood etc and with full ability to continuously tune the radio, hear the results - just as if the radio were right by you?
The problem seems to be how to provide a simultaneous data link and full/half duplex audio over the same phone line. Anyone know anything about so-called "SVD" (simultaneous voice/data) modems?

The internet seems not ideal for this type of operation due to:

a) latency i.e. delays
b) Problems integrating control s/ware with audio server s/ware etc
b) need to have the radio end on a permanent internet connection i.e. ADSL , ISDN, Cable.
c) need to have a second PC/software running at the radio end.

What I want do is:

1) Have only the radio and a modem at the remote end (preferably no computer).
2) A PC only at the user end with s/ware simulating the radio (like Umbra Systems ARCP http://www.halcyon.com/amreg/ for Icoms)

As an alternative, with Icom CIV rigs anyway, it is even possible to use one rig to control another via RS-232. i.e. no computers at all. I have tested this with an Icom 735 and a Icom 706 - either will control the other. The alternative is a PC running a remoe control package like the Umbra as mentioned above. What I am missing is means to feed the two-way audio simultaneously over the same phone line as the data (data can be as slow as 1200 bp/s but preferable 9600 bp/s).

Why do I want to do this? Primarily to "see if it can be done". But in fact the idea seems to have merit for any ham with deed restrictions, RFI, TVI problems in fact anywhere where a ham station is not feasible. The radio would go at a club site, another hams place, remote rural location or wherever.

Is there any Packet-Radio-Software available, to use a modem (not a TNC)
with WindowsCE, especially on a HP Journada ?

tnx in advance and 73
Andree, DL7UGH

I use the software from the november 92 issue of QST modified for a Yaesu FT-747. If you think it will work, I can send you the BASIC source for it.

FWIW, that link is good and includes an email address for K6STI. I won't
post it here because of spam.

Hi everyone,

Does anyone know where (if) are some HF gateways on APRS but on SSB mode? I want to setup such a gate but my rig (ICOM 730) does not support FM mode. So i need a SSB frequencie....Especially if its on 20 or 15m!

Please let me know if you know anything...

Gerald,

I, too, heard what you're talking about.

However, in their defense:
- The digital run wasn't all that well publicized. They very well might not have known about it.
- W1AW didn't give any information at all during the run what they were doing.
- W1AW finished the 10W transmission without giving any indication that they would be back. The last thing they transmitted was something like "This is station W1AW SK". To me, that SK means end of transmission.

Yes, the 1W transmission was totally hosed. However, the frequency was apparently empty when these guys fired up. W1AW didn't transmit at all for something like 30 seconds in between the power levels. There were a few seconds of dead air after the SK and it was several seconds before

W1AW fired up again at 1W. It's too bad these guys didn't hear W1AW come back on freq. and QSY, but they apparently didn't and, unfortunately, W1AW was down at 1W so it probably didn't QRM them at all.

IMO, W1AW should have transmitted at the end of each power level saying what they were testing and what power they were running. It should also have said that it would be back at the new power level in 15 seconds or whatever and should have transmitted at 100W before each transmission to make sure that stations that couldn't hear the low-power transmissions would know it was there.

Anyway, it was an interesting experiment and it's no surprise that W1AW got QRMed some on 20m and elsewhere.

Many factors can contribute to this sort of in-band interference. Even if W1AW had transmitted at the 1W level, the other stations may not have really noticed a very weak signal. Some digital reception can occur at signal levels difficult to detect by ear.

What will be most interesting is to note how many stations were able to copy the signal in the presence of strong QRM.

I don't know the exact frequency, but most operate at the upper end of 30 meters. There are also some recently on 10 meters. You could ask at aprssig@lists.tapr.org for more information.

Hi! I'm a newbie to packet, and I'm working on a project. I'm trying to get my HP48 calculator to remotely log onto my Linux computer to check my e-mail from anywhere within a 2 or 3 mile radius. I have everything set up except for the TNCs. Here's my problem. I need to set up both TNC's so that whatever I type gets sent to the serial port (ONLY what I type, nothing else), and ONLY what is received is printed on the screen. I'm using a KPC-3 and a KAM. I've turned Monitor mode On, and I typed in K to put it in CQ mode. Here's what I get:

```
#I want to send "123abc"

KI0PX>CQ: <UI>
123abc
```

The first line is what I want to get rid of. It's causing all sorts of problems, because the computer interprets everything literally. How could I set up the TNCs to do this? Anybody out there a Kantronics guru?

I hope my question makes sense. I basically want to use the TNC in its
most basic form, but I don't know how to do that.
Thanks for the help and 73!
-Ben Moss, KI0PX
I hate to ask this, but it would be nice if you could reply to
benm@cyberspace.org (I'm cross-posting, so I want to make sure I see all
replies). Thanks!

THen you need to turn monitor mode off. That is what is printing the traced packets.

What new dll version 2.0? The current version of PSKCore.DLL is still 1.09, updated 12/24/00. Where did you get this "new" version?

Oops, it may not be in the November 92 issue - that was just from my memory. Anywho, it was part of an article by Brian Bergeron on voice control of an Icom radio. In a later issue, another gentleman modified the program for a Yaesu FT-747, which was exactly what we needed for a similar project for a now SK. It was on the ARRL BBS as "Bergeron.zip", don't know about the modificatons.

Give these guys a break.

First of all it is the ARRL who screwed up!!! The ARRL did not transmit on ANY of the published frequencies!! The ARRL forgot to take into account the frequency of the audio tone being fed into the SSB transmitter

On 20 meters for the MFSK test, The ARRL said they were going to transmit on 14.080. They DID NOT! They transmitted on 14.081.

You would have thought that the ARRL would NOT make this mistake. When the ARRL transmits is RTTY bulletins they do not make this mistake.

I know a LOT of Hams who missed the test or a good part of the 100 watt test due to this blunder of the ARRL.

Even if these guys knew about the test, they probably thought that they were okay since they were a good 1 Khz away!

Secondly, they might not even have heard the ARRL (even when it was transmitting at 100 watts) if they are TOO close to W1AW. (I rarely hear W1AW on 20).

73's

Yes, but if I do that, then I won't be able to hear the other station
that is transmitting! I need two computers to communicate to each

other *directly*, with nothing else. What the KAM gets from the
computer, it transmits on the air. What the KAM hears on the air, it
sends to the computer... nothing else.
Thanks anyway!

Then you must first use the CONNECT command from one of the ends.

Then I am mistaken about the version. I must be thinking of another program's version number. The problem still exist in the dll version. If that computer was not off right now, I'd check. There is definately a difference between the original and the dll version as far as decoding.

Did W1AW even transmit MFSK16 on 30 meters ? I copied the 30 meter
PSK transmission, but for MFSK16 I heard 2-3 start tones, but no
MFSK16. Sounded like someone was having trouble.

Yes I did change frequencies for the MFSK16 transmission, 10.135
starting at 2118 13 Jan.

Rod

I have noticed this problem also. The author kindly sent an email indicating
that he did not know of any reason why the performance of the DLL version
would be lower.

Reluctantly I do not use any of the otherwise fine programs that use the

DLL.

I would be happy to help fix the problem if I could get the source code.

cheers,
Glen.

Glen,

I think the author has published the DLL since other programs use it. He

may even give you a copy to see if you can improve it. I really like
WinPSK, especially the updated version, but the DLL version does not decode
worth a hoot. I used to think it was just my system until my friend WI0T
mentioned the same thing. I told him I would post to the group to see if
others noticed the same thing. Some of the mail I got confirmed we are not
the only ones.

Regards,

Duffy

Yes, W1AW did transmit MFSK16 on 30m. Near-perfect copy here on 30m at all three power levels (almost no copy on 20m and 10m; 80m was pretty good, but not as good as 30m). The "idle" tone was at approximately 10134 kHz, and they were using LSB (i.e. the other tones were at lower RF frequencies).

Although this wasn't specified, in retrospect it is clear that the frequencies published in QST were the "suppressed carrier" or indicated frequencies on an SSB radio, assuming the audio frequency was at about 1000 Hz. USB was used for PSK31 (well, at least that's consistent with the observed frequencies on 30m and 80m; I never even detected W1AW on PSK31 on 20m and 10m, although I did manage some partial copy on MFSK16 on those bands), and for MFSK16, USB was used on 20m and 10m, LSB on 30m and 80m. A lot of unstated assumptions you were supposed to figure out as part of the exercise?

Re choice of sideband: the convention for HF FSK RTTY makes "space" the lower RF frequency, regardless of band (i.e. by convention LSB is used on AFSK on all bands). It would make equal sense for the convention for MFSK16 to stick to USB, making "idle" the lower RF frequency, regardless of band. However, ZL1BPU's documentation defines a different convention: "All MFSK operation is on USB above 10 MHz, and LSB below 10 MHz". W1AW chose not to follow either convention. The signal was strong enough here on 30m, and there was so little other activity on the band, that I found it easy to see what was happening and change sidebands to match. If the signal was weaker where you were, you might not have had such an easy time of it.

Re choice of audio frequency: the choice of 1000 Hz is purely for the operator's arithmetic convenience (it's easier to figure out the real RF frequency from the radio's indicated frequency using a round number audio frequency). If you are using wide (SSB) filters, there are technical reasons to choose higher audio frequencies, so that the second audio harmonic is outside the radio's filter bandpass. And if your radio allows you to use narrow (CW) filters in SSB mode, of course you have to put your audio frequency inside the filter bandpass. On my radio, 1000 Hz is well outside the filter bandpass.

Re published frequency: on RTTY, the convention is to quote the "mark" frequency, not the AFSK suppressed carrier. In PSK31, the logical convention would be to state the unmodulated carrier frequency. And in MFSK16, the logical convention would be to state the idle tone frequency. Leave it up to the operator to add or subtract whatever audio frequency he or she is using, as appropriate, rather than making assumptions about the choice of audio tones.

Maybe the ARRL deliberately chose something different in order to make the exercise a bit more of a test. By doing so, however, they increased the likelihood of inadvertent QRM.

Rich, VE3IAY

As previously reported on 10.131.86 mhz ... it seems to have moved to
10.128+ (USB) ... with that same 850hz shift. It's been on every night.
I can't seem to decode this broadcast ... and am hoping someone else
can help me understand what this is all about. Frankly, I'm surprised
there has not been some discussion about it.

Oh, I'm sure this has come up before. I've just heard people refer
to it as 'THE teletype signal', and leave it at that.   I've heard it,
I have no idea what it is.

Well that explains it, I'm almost 100% sure I left the radio in USB after the PSK transmission and just tuned to 10.135.

If it had been RTTY, I would have switched to LSB...

Thanks for the info.

Hi,

Well it does NOT make sense to use dial frequencies and an assumed 1000 Hz audio tone. You do not do this with RTTY etc.

Like RTTY, you do NOT know what audio tone is being used by the other station. To make matter worse, with ANY of the MFSK programs, the audio frequency could have changed due the AFC if you were monitoring some other MFSK station.

Unlike RTTY, the frequency of the audio tones are NOT fixed but change due to the AFC.

I know a lot of stations who missed copying the digital run on 30 meters since W1AW used LSB!! The OLD convention was to use USB on frequencies ABOVE 10 Mhz!! The ARRL did not do that.

Let's face it the ARRL messed up!! I hope the ARRL has the courage to admit it!!

By the way, Murray, ZL1BPU JUST changed the "convention". Now you should transmit MFSK with the idle tone being low!! That means transmitting using USB with STREAM.. OR you could transmit using LSB using HAMSCOPE with the LSB Invert Tones option!

You should NOT be thinking about whether USB or LSB should be used on MFSK but rather the orientation of the tones. You should transmit with the idle tone low!

But since some stations may be using USB with STREAM and other using LSB with the invert tones option using HAMSCOPE, the ONLY way to report the frequency is to report the frequency of the low idle tone.

The ARRL did NOT do this.

It should be noted that the BPSK mode of PSK31 is sideband independent.

The ARRL could have also been transmitting PSK31 on 30 meters using LSB.
You cannot tell.

If you were using RTTY you could have also keep using USB but with LOW TONES
(like many Europeans).

Once you connect to the Linux Station, it will see

```
*** CONNECTED to <callsign here>
```

Then you can type whatever you want and it will see it as you type it line by line.

I'm was working on software that will interface with my home TNC via HF and download my email to me while I'm on the road, but since I got the Nokia Data Suite and PCS Dataconnect, I just connect using my laptop. Plus I can surf the net from my vehicle on long trips (when my wife drives, of course)

Now I just write packet terminal software. Small hobby.

The Soft990 by F6DEX is available here: http://www.trx-manager.com/
The DOS-version seems to be freeware, despite the name it works
with FT-920, among others. Win-versions (TRX Manager, FT-manager)
```

```
are commercial, alhough limited demos are available.

Myself, I've just spent last night trying to figure out how the CAT of
FT-920 works. According to the manual it seems quite straightforward,
but still haven't got it working properely. Some commands work fine,
where as some requiring more than 1 parameter in addition to the
opcode are not. So, for the time being, I have a program that
can set SPLIT on or TUNE the antenna, but nothing else. :^)
I am doing this on Linux platform, as I could not find any
ready-made software for this OS. I'll keep on trying..

One of the real losers of AMSAT is AMSAT-NA web page.
It has all the statistics of being bankrupt.

However, the AMSAT-UK web page has real-time value:

Another site for uptodate info (usually), directly linked to the command stations via mail from DB2OS to DL6DBN:

http://www.amsat-dl.org/journal/adlj-p3d.htm

(the UK site is cutting/pasting those, and items posted by DB2OS on amsat-bb)

Rob

Latest news:
Dear All,

We are pleased to report that the AO-40 Flight Software is now completely re-loaded, excepting the D-block and WOD routines which can be done later.

James G3RUH found that commanding on L-band was very easy. Even at a very bad pointing angle of ~50 deg he could uploaded a non-FEC block on 4 watts at the TX (~250w e.i.r.p.). Thus the L-Band uplink seems to work nominally and excellent..

73s Peter DB2OS for the Command Team

Has there been any rewrite or compile for WA8DED code for PK-12 TNC's ?

This code was great for Z-80 based PK-88's and TNC2's for BBS's.

Thanks
Ken VK4KWM.

I could not agree more that the AMSAT-NA web page is horrible. Thanks for posting the other links. Looks like the Euros know how to develop nice and informative web pages.

Regards,

Duffy

Neither do you.

However they have people already interested,   they have tested links,
and they have high bandwidth and they have dreams.  Your dreams are
nothing but memories of 20 year old packet radio, without a license.

Timewave's special Y2K price for PC PakRatt Ver 2.1 for Windows 3.1 will
end on Jan. 2, 2001!  The old price of $29.95 for the upgrade has been in
effect for the entire year 2000 and will change on Jan 3, 2001 to $59.95.
This means you must order now if you want the $29.95 price.

The price for the full version of PC PakRatt ver. 2.1 for Windows 3.1 will
change to $99.95 on Jan 3, 2001.

Contact Timewave via:
Telephone  651-222-4858
FAX        651-222-4861
e-mail     sales@timewave.com
website    http://www.timewave.com

If you are using Windows 95, 98, ME, or 2000, we recommend you use PK-
Term'99 available from http://www.cssincorp.com (256-381-6100).

Let's be careful not to confuse "wireless" with "wired". I tend to suspect that the two will not compete in the same space.

> Given the prices of telecom infrastructure, and market demands for
> short-term profitability, there will be at most two high-speed
> access providers in a given market.

This is fair, but does not imply that wired and wireless operators will be competing head-to-head in the same "high-speed access" space.

> Most consumers are willing to spend only $30 to $40 per month on
> high-speed Internet services. This price sensitivity was created by
> experiences with dial-up and marketing from cable modem providers.

An increasing number of consumers are apparently being convinced that Internet access is like the ether through which radio signals propagate, thanks to subsidized efforts such as bluelight.com (which ended up buying the ISP part of spinway.com when spinway ran out of money and went belly-up).

There is no such thing as free Internet and anyone that thinks otherwise is ignorant, naive or fantasizing. A harsh fact but reality nonetheless.

A subsidized service that costs users nothing is not free.

[Good, but contentious business analysis of ISP access business deleted]

I won't quibble with your numbers and assumptions here, other than to say I think you're making some extreme assumptions to end up at the conclusion you do.

The simple point, wired Internet backbone is not cheap, especially when you scale up in terms of traffic and availability.

> given the economics as I have outlined them above, in urban spaces you'll see maybe two competitors for high-speed data services. In suburban and rural spaces, there will be at most one player. It's highly likely that a single player will in a market will discourage any other potential competitors from entering that marketplace.

I don't believe the wireless and wired ISP space unify as you apparently do. In the United States, the penetraton of wired Internet is relatively high, let's just estimate it over 60%, and the wireless telephone penetration has historically been much less, let's just estimate it below 30%. In Europe, this is inverted; in some European countries, wireless penetration is easily over 70% and wired ISP is well under 30%. To be fair, wireless penetration is showing signs of exploding in the United States and may rapidly grow past the 50% mark, but it's already pretty clear that wireless data services will not directly compete with wired services.

It is not likely that people desiring broadband service will turn to wireless, and people interested in mobility are not likely to require the same level of broadband performance, at least in the US. When you cut away the hype, wireless is about *services* and wired is about *broadband*. The two don't directly compete.

Of course, I could be wrong. I'm certainly not attempting to invalidate the core of your argument that there isn't room for a lot of competition in the "last mile" of access, I'm just not as willing to believe that wired and wireless are truly equal there.

I'm not sure who "everyone" is here, Cathryn. There's certainly a push
towards high-bandwidth capability but the network cost models that I've
heard don't support the notion of a lot of high-bandwidth traffic. Instead,
the focus seems to be on reducing latency and improving user response of
wireless services.

Wireless video to handsets - perhaps for news clips, but think about the
experience of watching a movie on a handset; it isn't appealing. People
have relatively short interactions with handsets.

a) I believe you're giving the hype far too much credit.
b) The technical issues aren't nasty and aren't the real issues.

I agree but probably for different reasons. :-)

> belly-up).

very good point. this is the reason why one of my clients (ZipLink) went belly up a month or so ago. They had a very nice network and dial-up access infrastructure. They were selling access to people like spinway but when two of the subsidized ISPs went poof in one month, they lost a big chunk of their revenue which caused them to go poof as well.

>
> There is no such thing as free Internet and anyone that thinks otherwise is ignorant, naive or fantasizing. A harsh fact but reality nonetheless.
>
> A subsidized service that costs users nothing is not free.

the free Internet service business is a poorly transported idea from the UK. The reason they got started there was because of arrangement between some ISPs and British Telecom. In the UK (as well as other parts of Europe) all calls are billed by the minute. Some ISPs were able to convince British Telecom to split the per minute charges when users called their modems. Therefore, the "free" ISPs were actually paid out of your phone bill.

In United States, free ISPs couldn't work this way unless they were a CLEC. Most of them counted on transfer pricing models based on advertising and some even required the user to click through on advertisements every 15 or 20 minutes in order to maintain the connection.

The free ISPs that were CLECs survived because of a quirk of the telecom act of 96. At that time the Baby Bells were only thinking of competition in the local loop arena. They slipped in call termination charges figuring that any CLEC offering local service would have to pay them for calls terminating on the Baby Bell networks. They saw it as a gold mine or a way of keeping CLECs in their place because they figured more calls would terminate on the bell network than on the CLECs network.

In comes the Internet and dial-up access. All of a sudden you have CLECs forming that only accept calls in the form of modem connections. The Baby Bells are now paying millions to these CLECs for all the CLEC terminated calls. The Baby Bells start crying foul and try to change the rules that they created. This was the source of the flap about Internet related calls being classified as long distance (i.e. no call termination charges) vs. local calls (i.e. call termination charges)

>
> [Good, but contentious business analysis of ISP access business deleted]

:-) I try my best. Look for another contentious business analysis further down.

> I don't believe the wireless and wired ISP space unify as you apparently do. In the United States, the penetraton of wired Internet is relatively high, let's just estimate it over 60%, and the wireless telephone penetration has historically been much less, let's just estimate it below 30%. In Europe, this is inverted; in some European countries, wireless penetration is easily over 70% and wired ISP is well under 30%. To be fair, wireless penetration is showing signs of exploding in the United States and may rapidly grow past the 50% mark, but it's already pretty clear that wireless data services will not directly compete with wired services.

remember, most European wireless Internet access is WAP or WAP like. People don't browse the Web on their cellphones. They send messages, they pay for soft drinks, and they even call each other.

>
> It is not likely that people desiring broadband service will turn to wireless, and people interested in mobility are not likely to require the same level of broadband performance, at least in the US. When you cut away the hype, wireless is about *services* and wired is about *broadband*. The two don't directly compete.
>
> Of course, I could be wrong. I'm certainly not attempting to invalidate the core of your argument that there isn't room for a lot of competition in the "last mile" of access, I'm just not as willing to believe that wired and wireless are truly equal there.

I like this perspective but if you do the analysis on the perspective you find that the business case gets even worse for wireless. It gets worse because you need to look at who is going to use the network and for what. WAP is a nonstarter for a variety of reasons but mostly because of usability and speed. I've seen some reports which describe taking two to three minutes to get a weather report.

If it is users with PDAs and laptops, then you need to find enough people willing to spend a monthly fee ($10? $100?) for an intermittently used service in addition to what ever services they are currently using.

Cellular telephone works because the handsets are cheap and there is enough margin in the business to pay for the infrastructure or there's enough money in the parent business to subsidize the wireless. I'm not sure, I haven't done the analysis.

Cisco had a wireless product for last mile wireless that unfortunately, seems to have sunk without a trace. It was capable of delivering 40 Mbps per sector over a 3 kilometer radius cell. It cost approximately $100,000 per sector for the cell site equipment, another $50,000 to install, and $1000 for each customer's cpe equipment ($500 for the hardware, and $500 for the truck roll/site survey).

They estimated that each cell could handle approximately 1000 customers. Assuming that each cell was full (to closer approximate the cable model given earlier), the infrastructure costs is much lower (core infrastructure is $300 per customer) and the monthly costs are about $6000 per month higher because of tower costs.

At $40 per month, your revenue would be $40,000 versus a run rate of $86,000. With more cells, you can drop the per cell run rate because you can spread your people costs among multiple cells. You will need to spread them mighty thin because your fixed costs are about $36,000 per cell.

a more realistic analysis would put the cell population closer to 400 subscribers per cell which dropped your monthly revenue to 16,000 per month which doesn't even cover the cost of your T3.

now I'm not sure about the costs of 3g wireless equipment yet but it's probably going to be more expensive than what Cisco was selling. When you add into the mix the cost of spectrum fees and the low perceived value for mobile Internet access, it's a recipe for financial disaster.

I also don't believe that telephony services will help subsidize the data services because I don't think regulators will let wireless or fiber based services replace POTS for lifeline services. One good thing about copper based telephony is that the receiver can be passive and will continue to function even in a power outage. The same cannot be said about any telephony service requiring power for the CPE.

So to bring things back to the intersection of wired vs. wireless Internet service, the only way wireless companies can justify their infrastructure costs for high-speed wireless data services is through a mix of mobile and fixed point services. This means competing with cable companies and DSL for customers. High-speed wireless service is competitive with DSL because they can sustain comparable data rates. High-speed wireless services can also compete with today's cable services because both services deliver comparable data rates.

is high-speed wireless going to happen? Eventually but not as quickly as people think. My opinion is that it will take approximately 10 years before high-speed wireless service is deployed. The reason for that kind of delay is based on my estimate on how long it will take to pay off the current cellular infrastructure. I think a reasonable model for the deployment would be to look at Sprint's PCS deployment.

I'm new to APRS and was able to get it running on my Kenwood TM-D700. What
i'd like to do is put something together to bring with me in the car when I
travel. The easiest tracker I think I could assemble would be one of the
following.

Kenwood TM-D7A(G)
Garmin GPS III

or

some transceiver (not sure which one)
Kantronics KPS 3 Plus w/ GPS (assuming I can find one)

Could someone recommend a better or less expensive option? Thanks.

Tim

I built the TinyTrak by Byon Garrabrant and it is a
wonderful little device using a PIC processor.

I'd recommend it.

Hi,
my question sounds maybe curious. I've found just one web page link related
to this theme and it's out of order a long time:
http://www.tu-bs.de/studenten/akafunk/pr8051/index.html
Frankly, I'm looking for open source code ['near to #include' in .asm or .c] of
(AX.25) HDLC protocol implemented in 8051/AVR/Microchip PIC microcontroller for
simple networked slow data/telemetry modem purpose. Or should I start to
reinvent another media access and network layer?

Any hints or pointers will be highly appreciated.
Thank you.
Tom Iansta

3g (UMTS) can only be a disaster, period.  At least here in Europe.

Companies have paid ridiculous amounts of money for the spectrum usage.
In some countries the price was quite low, but because every telco over
here has acquired companies in other countries, they all have paid billions
```

of dollars one way or the other.

For example, in Germany the telcos have paid about one thousand dollars per inhabitant of the country for their license. Of course they will not be able to sell a subscription to each and every inhabitant.
No matter how you tweak it, they will have to re-coup several thousand dollars per subscriber. Over a period of several years, of course, but considering the rate of development it should not be more than 10 years until the next generation comes along, more likely 5 years.

So, for the license alone they will have to re-coup much more money per subscription than the current GSM subscriber ever spends. And then there is the hardware, the sites, the personnel...

The price was driven up because the auctions took place in the "new economy bubble" period that also saw skyrocketing share prices. After the collapse, some telcos already got in financial trouble and had to layoff people.

Rob

Visit www.tapr.org and have a look at the sample PIC Encoder
code. There is PIC assembly code that implements AX.25 UI
frames and HDLC in both directions.

I don't recall just how open it is, but it's there and well
worth a look.

It just takes time. Much of the information on the AMSAT-UK
web page is due to the work of one person who has taken the
time to gather the information and put it there.

Are you volunteering to do something similar with AMSAT-NA's
web page?

I ran mine to the "packet" connector. I think that's the 5 pin DIN. It works fine, but I have to run in the packet mode which is LSB only. That's not really a problem, but you do have to make some funny translations to determine the frequency. If you run a mode where the sideband selection is critical, then you'll have to invert your signal via software. I think most of the programs have that option. Psk31 doesn't need this however.

Jim.

I still can't imagine how you will maintain data-quality
transmissions when you are trying to receive a low-power
station a mile away, and the kids next door are talking
on top of you.

It seems this will be the practical limitation, so few
channels and a buttload of "VHF-CB" users.

Martin

When you are looking for .c code (and thus not dependent on the processor),
you can look at the Linux kernel. It has HDLC code for use with bit-banged
modems on the serial port ("Baycom") and DSP-based modems on the soundcard.

Of course the great thing about the WWW is that you can have a hyperlink that provides single-click access to information you are not prepared to provide yourself, but is provided by other people.

But there is no such link in immediate view on the AMSAT-NA p3d pages. This of course means that many US hams never know that other AMSAT organisations provide more uptodate news reports.

Rob

Hi Folks,

Thanks for reading this and a happy new millenium to you!

I have a Kantronics KAM w/Enhancement Board, firmware Ver 6.1
I've read the bit in it's manual about NAVTEX and am already somewhat
familiar with the service. I'm on the coast :{D and I've found what
appears to be a regional NAVTEX beacon site on 518 kHz with my little Sony
7600. However not sure if NAVTEX is 518 kHz reference, mark or what, nor
which mode I should have the radio in, ie LSB/USB. I've used HF packet
quite a bit and done a lot of RTTY/SITOR/AMTOR monitoring in the past so
familiar with reversed signals, shift and rate parameters. I'd like to get
the Kenwood TS-440SAT on to this project and improve the antenna
situation when possible.

In the 1999 Canadian Coast Guard publication Radio Aids to Marine Navigation NAVTEX is listed as F1B/radioteletype and only two stns are listed, Prince Rupert ID 'D' and Tofino ID 'H' which is one I'd be more likely to receive. What I do pick up is 'CL' in cw. Is it American? A look through my old FAA Location Identifiers pub and Grove's Shortwave Directory don't reveal anything on CL. Neither does my '96 edition of the Canada Flight Supplement.

Any ideas on how to improve my chances or ID what I have found would be appreciated. Even talking with a local Cdn Coast Guard telecom tech didn't help.

Thanks for your time es 73, JD VA7JD

Are you really worried about someone stealing or messing with you QSL cards? Try a password software program to remember them for you.

Use a simple password like "me"!

Its easier than addressing and sticking a stamp on an envelope, and you can do your whole log in a minute or two. In the time you took to answer that post you could have QSLed everyone in your whole logbook!

If you think its too hard, I doubt you QSL by any method unless its for yourself. I do it for all the people who want the confirmations!

As an active station I try to QSL 100% but it gets more expensive every day, especially for DX. In this age of international Internet usage this sounds like a good idea. As I have been working on a Digital mode DXCC the last year and half. However, will these be accepted by the various awards committees for credit?

I think it is at least worth a look at even for one more password.

How about a couple of IDC connectors with an inch or 2 of ribbon cable between them. You could make that go in any direction is it was a few inches long.

I have an old back shell (for 25 pin) here that has the cable coming out at a right angle, so they do (or did) exist.

I reckon, with the aid of a stanly knife, some duct tape and a bit of butchering, I could turn a 9 pin D into a low profile right angle connector. And toss the long knurled screws and use the shorter screwdriver jobs.

Have fun.

A couple folks asked that I repost my specific suggestions on how to migrate the existing BBS network to the model in current use on the internet. Here they are again. Not well organized, a bit of babble, but specific ideas. Would they work in practice? I've implemented some of these ideas in SNOS, and they appear to work fine.

Each BBS network message type has an equivalent internet application and protocol. For the BBS network to interoperate with these applications and protocols we need some number of "gateway" systems which do the appropriate translations.

1) Bulletins map to net news and the nntp protocol. We need a set of newsgroups defined to map to/from the common BBS network topics. One solution would be to use newsgroups of the form alt.<distribution>.<topic> where <topic> is the To: field of the BBS message and <distribution> is the @ BBS field. Thus we would have, for example, alt.amsat.keps, alt.ww.sysop, alt.usa.all, etc. The gateway servers would move messages both directions using the obvious and simple mapping.

2) Personal messages map to standard email and the pop3/smtp protocols. We can use the obvious address mapping. I've run this kind of gateway server for years, initially using a version of JNOS and recently using SNOS. It works fine.

3) NTS messages are an intersting case. They probably need to map to net news and the nntp protocol. We might use a newsgroup such as alt.usa.nts-traffic for this purpose. In this case the same gateway servers which handle 1) will suffice. Ideas welcome from the NTS folks on how we might handle this.

Note that we do not need "permission" from NIS or anyone else to begin to implement this capability. Everything exists within the ham radio network and not within the internet per se. The model is designed to be compatible with internet standards for the obvious reason: those standards exist and are well tested. We should use them.

For some of the standards, file transfer protocols also exist. For example email has pop3 and smtp as network data transfer standards, and RFC-822 (and it's various updates) provide a guide to the construction of a bulk transfer protocol. We already use this protocol as import/export between BBS systems of various kinds. The needed extensions to the standard set of headers are documented in the BBS specification. For net news two standard transports exist. One is a bulk file transport using the "ihave/iwant" scheme similar to what is called "X forwarding" in the BBS network. The needed mappings are obvious and should be simple to implement.

All the above would require only a small amount of fairly simple programming effort on the part of the authors of the ham radio tcp/ip programs, and very little effort on the part of the authors of the ham radio BBS programs. The hard work is deciding on the details of how the mappings will work, and setting up enough gateway servers to attract users.

One advantage of this scheme is that we could use it to link existing news groups in the internet directly to the ham radio BBS network, with bidirectional exchange of messages. Some might consider this a disadvantage because of the obvious possibility of abuse by both hams and non-hams. This possibility should not get in the way of creating and testing the technology.

There is an interesting technique we could use to do this integration. If each "gateway" server ran a web server with a standard middleware API to a local database, then the task of programming the needed applications would be fairly simple. What applications are needed? Those required for the administration of the "gateway" server itself, for example, to maintain mappings, deal with exceptions, and all the other "sysop" type of activities.

One could even consider creating a "regular ham radio BBS" using the capabilities of the web server. This has in fact been done, several times, by various hams. Perhaps those hams might consider making their work available to others in the ham radio network as well as on the internet. Doing so might help move the digital networking facet of our hobby forward. i.e. "The folks using html on ham radio are headed in the right direction."

Disclaimer: Yes, I know the above sounds a lot like the integration of ham radio networking with the internet. That is exactly what it is. I hope everyone can understand the difference between taking ideas and techniques from the internet for use in ham radio, and replacing ham radio with the internet itself. I propose the former, and not the later.

I would agree, that continued momentum of the BBS system
should have petered-out about 5 years ago.

I think the attitude was: "if it ain't broke, don't fix it." But that attitude is like the justification for someone continuing to drive a 1971 Pinto.

I might have even been interested back then. But packet radio is dead (RIP). Most everyone has gone back to non-packet radio, such as PSK31 and the other new modes. I talk one-on-one with other Hams, and it's like comparing a phone call to an email. It's much more dynamic and that makes it interesting.

The whole purpose of the BBS was emergency communications. The other messages were filler, that would cease when an emergency was declared. Now a'days you can't shut the filler off, and the emergency comm's go by un-noticed.

No, I think FEMA should do emergency stuff, they are paid extremely well, and Hams should stick to hobby stuff. There is a roll for Hams in disasters, but packet switching communications isn't one of them.

I thought APRS would be an excellent disaster tool, but looking at it this last week, I don't see any evidence of it's being used for all the power black-outs over the Plains.

That is a hugely USA-centric view of packet. If you look in many parts of the world outside your 50 states, you'll find there is still a fairly healthy packet network.

Here in the UK our network is currently beginning to fall part, mainly because the idio^H^H^H^H misguided people who claim to run it can't grasp the fact that internet linking has never done anything other than destroy packet RF networks.

Well I know that must be true, because most of the traffic
on U.S. BBS systems today comes from South America :-)

These ideas are not new. Most of them were tried and implemented in a couple of different TCP/IP packages.

Technically they work. That is not the problem. But in practice you will have the problem that it is very difficult to get enough BBS sysops interested. And capable to run the system.

8 years ago I did some work in NET to allow co-existence of NET as a packet radio and TCP/IP driver program (with Z8530 SCC cards or KISS TNCs) with a standard BBS or DX Cluster (or both), all running under Desqview on a DOS system.

This was done by implementing a G8BPQ-compatible API in a kind of "pipe driver" loaded before Desqview, and having all programs communicate with that (via a hostmode-to-g8bpq shim when required by the application).

Gatewaying of mail and bulletins was also provided.

This worked beautifully, and still does for some BBSes here. The big advantage for the BBS sysop was that he could use an SCC card, would have a NET/ROM node and TCP/IP functionality in addition to his BBS or Cluster node (required to interface to our NET/ROM network), and needed only a single 386-class PC to run it all.

So there was a big incentive to get this working. Still it required a very dedicated person to coach the sysops in configuring it all and explaining the tricks. Outside of the coverage area of this person the system found little use. There was documentation but only the most "computer-oriented" BBS sysops would setup the system using documentation.

I expect it will be the same with any new "complicated" (in the eyes of the sysop) type of system. When there are no really big advantages that the BBS sysop himself will see, he will usually "leave it to others" to install it, and will continue running the familiar setup himself. This would be especially true for a system that tries to bridge a gap between the protocols that have conquered the world, and the protocols that unfortunately were invented in parallel by HAMs (who were at that time usually claiming those other protocols were inferior and inefficent).

It would be much easier just to ditch the BBS system and replace it by the usual stuff found on Internet. Many implementations already exist and some are not too difficult to install.

Rob

And today, the BBS style store-and-forward principle is still very attractive for emergency communication. E.g. in a search operation in the middle of nowhere, a battery powered BBS stations can be put up on a hill and all the portable stations can connect to it when it is convenient (e.g. when on top of an other hill) and thus, minimise the power consumption of the portable station. Of course, some means are also often needed to connect the BBS to the rest of the world.

In the days of common multitasking computers, I do not see many other applications requiring a store-and-forward system.

I know that Saudi Arabia launched 2 satellites awhile back called Saudisat
1A & 1B and they were suppose to be for amateur use, I thought!
Has ANYONE any info on these satellites and are they still active, or in
commissioning stage or what.
I cannot even find a web site acknowledging their existence!

Btw, Hank, getting back to the original subject, have you looked at mailgw for Linux.

http://radio.linux.org.au/pkgdetail.phtml?sectpat=packet&ordpat=title&descpat=&pkgid=86

This program works with FBB and inn, running on the same machine, and is able to move messages in both directions. It's a little finicky, but with a bit of tweaking it works. On the News side, and on the PBBS side, it adds extra lines, so that messages can transfer neatly between nntp and pbbs while killing the dupes and all that. This munge the email addresses and the PBBS TO and FROM fields into newsgroups according to a big chart.

How were you thinking of handling the news side? I think easiest from a NOS style system would be to setup an NNTP server, either Linux or Win2000 -- or where you thinking of writing an NNTP server for NOS. (And, maybe this wouldn't be insanely hard, if you weren't connecting with regular Usenet, and just ran a ham radio only NNTP network. Still a lot of work though, I suspect.)

I don't think this is so. Correct me if I am wrong but RCKRTTY did it
first. RCKRTTY is also less expensive.

Actually helical and yagi work very well. Then there is also notch and
patch style antennas.

>antennas. For portable applications, you'll be lucky to get much more
>than 500yard range without dishes. Feedline losses are IMMENSE, so

You must mean both ends being portable, right? Because with one end
fixed you can get MILES to an almost invisible antenna (think GPS).

>you'll have to pay a pretty penny to get your antenna up high - or you
>could put your radios in NEMA boxes on towers!

That's actually pretty close to what they are doing. Radio and router
near or at the antenna. Then you just need a data cable going down.

>MURS). Anything above 900Mhz is basically for building in-plant, in-
>house networks.

You are hilarious. http://www.seattlewireless.net/ and a dozen other
similar projects around the world mock you.

>Look, all this stuff is so much hot air. High speed wireless(with a
>decent range) is basically on hold until the FCC can work out the

Think again. How many miles does it take to make "decent" ?

>Besides, all this stuff costs money. There is a recession coming, and

That's for sure. 11mbit(peak) 802.11b runs about $200 per node plus the
computer and probably a bigger antenna.

>Linux boxes are basically free, and many people already have Cable
>Modem or DSL connections - even a NetZero(free) connection will do.
>All you need is a $109 radio, a $40 surplus TNC, and maybe an antenna
>and feedline if you're not on a hill.

Forget the TNC and get a $200 radio, and you just described 802.11b.

>and you aren't?

Nope.

http://www.Seattlewireless.net/
http://www.consume.net

there are others growing all the time.

almost all of the wireless wide area networks are based on 802.11b hardware.

Do you have any pointers to anyone who actually has
something on air and working?

Seattle wireless has been playing with the idea for a long time,
but has nothing up and running yet. Just talk.

I have some input on this.

I stated a 1.6 Mbps (pseudo full-duplex) network link in
Oklahoma City (Proxim Range-Lan stuff). It served us
faithfully for over two years. Mostly weather related problems
such as Ice and water ingestion.

The object was to go from the ISP to my house, and then off
to another house. Each of these "nodes" would then have a
360 degree coverage Symphony network for local neighborhood
LAN's.

Prices have actually gone up on just about everything except
the radios. We got two of the nodes up, but could not find
a link mid-way to the ISP.

The bottom line was, that we could not get anyone else to
join the network. They would join if I bought everything and
hooked it all up and maintained it, but the bottom fell out when
there were no customers interested. Now that I have taken
the equipment down and replaced it with Ham stuff, I am back
to where I started--hobby radio :-)

Rob

Maybe I should have said the first U.S. based 'Host Mode' commerical application. I stand corrected.

RCKRTTY does suppport TNCs, execpt it only supports the WA8DED host mode on the PTC-II and the HAL DXP-38. It doesn't support the host mode on the Kantonics or AEA/Timewave line.

We support the Kantronics and AEA/Timewave line in host mode, which does allow us to use the TNC for keying in PSK-31.

RCKRTTY is a fine shareware product. Most of the time, the shareware product is supported by a single person (the author) out of his home. With a commerial products like ours, a staff that allows sales, support and development is a much better value for the end user, since we can focus our efforts between people instead of one person sharing all responsibilty. And we can provide the dealers a revenue stream, by them being able to resell it.

With the ham market so small, we're trying to help the dealers stay in business and let the ham community benifit from keeping the ham economy strong.

Rick - W4PC

Has anyone used the FT-990 interfaced to a sound card? (I can't download from rec.radio.amateur.digital, so I hope this newsgroup is not too far off topic).

My FT-990 has an accessory jack on the rear marked RTTY. It appears to be ideal (pins 1-4): Shift   RX Out   PTT   and   Gnd. The "Rx Out" is fixed volume at 100 mV.

Can I just wire these direct to Shift-->Line Out, and RxOut-->Line In ? Shouldn't need attenuation? And either use VOX for PTT, or run a line from the Com2 to "PTT".... do I need a transistor driver? Thanks, David   AC4BN

Hi all,

Looking to see if anyone is aware of a way to export log files from the XPWIN format to ADIF (or CSV, or anything). Trying to get the log data in Logger.

Thanks -

- Seth N6BMB

I don't have an FT-990, but that RTTY input sounds to me suspiciously like
an FSK input, i.e. the "shift" pin is probably not an audio input, but
rather an FSK keying line (if so, grounding that pin would shift the
transmitted carrier by 170 Hz). Try the "packet" accessory input instead. It
was probably designed for AFSK, and would have all the signal inputs and
outputs you need for sound card digital modes.

VOX may work fine for PTT, but if you want or need to use a Com port for
PTT, you will need a transistor driver to convert between RS-232 levels and
your radio's PTT level.

73, Rich

Key word there dude is "basically"! I found the "hardware" for $55. His
point is very realistic.

I run UIView APRS, WinPack BBS (and everything else) on a $55 (TOTAL)
Pentium multimedia box. I did add a V90 modem for FREE 50KB (actual)
net access. So I have everything I need to send HTTP over the air with
AGWPE (new version 2000.78 is out). It doesn't even need Linux. Linux
is an interesting option though.

http://www.raag.org/sv2agw/

If you don't have any ideas then you better move out of the way. :)

For 1.9 GHz, you should probably use "polyiron" instead of ferrite.
Available from suppliers
such as Emerson and Cummings.

I guess I didn't make my concern clear.  How do you plan
to maintain a reliable connection?  You will be receiving
```

microwatts, and the neighbors' kids will be keying up on top of you from 200 feet away. Remember, you won't "own" any channels anymore than you could on CB. This is an issue of practicality, not legality.

Martin

> Have you heard of Metricom Ricochet?
>

OK so I answered you Q and you just ask this? Well yes I have. I do not know everything there is to know about them.

I do know you missed the glaring point. My idea has no middle man. It works like APRS works. How is that paid for. I think we could have a low cost radio computer combo.

Have *you* heard about the modified wirless LAN cards? That's if you want hi speed (we do). If everyone with a computer had on then we could all be on a shared network. Something like the advanced Linux experiments where you have NO server. Everyone is part of the server. If one goes out then it would just use another. Likewise our computer radio would always be available for LOCAL transfer. Didn't your mother teach you to share.

It could start with small local networks (ie your neiborhood). It could be linked through the internet as a backbone at first or permanantly.

Now will your take these idea's to your supervisior and make them a toll (paid) monthly per minute charge? I don't care because I will create with freedom.

There's a big difference in saying that we'll have to work around a given obsticle and simply harping we can't. This during our whole process of hard work, synergy and God given creativity.

> > Get people on board with real communication benefits. Make it full-
> > duplex.

First you brag on comercial full-duplex and then you ask this. Don't you know. It depends.

> > Use $20 FRS rigs.
>
> Why? How does this actually help? The FRS radio alone is just
> a narrow-band FM radio with no data capabilities. What do you use
> for a modem?
>

Well, because it's $20 darn bucks. It's alot for $20 if we use it in a
network (or repeater, or digipeater, or internet linked, or whatever).

Now let me ask what *you*. Haven't you heard of AGWPE? Don't you know
we don't need a TNC anymore. Also, like I'm saying; we could write any
wirless protocol for a soundcard. It's a DSP. Soundcards are $20 NEW!

> > Make it as fast as commercial robber-barrons at no charge. Hey mabey

Everyone has an opinion.

So anything new or that needs ironing out is half-baked? Well I guess anything "baked" was half-baked before hand. Do you take your cookies out of the oven when they're half-baked and throw them out too?

Do you see when an idea is "baked", then your basicaly done creating it. It's not an idea then. Don't rag on peoples ideas. It's imature.

> > How is Linux created for free?

>

So it's half-baked too? First, your kind says there's no big companies involved. Then you suggest those companies now on the bandwagon are a cash cow. Wrong.

I don't think you WILL get it. Open source works. It's a different persective. You're suppose to be good at that. Remember? Why don't you get it?

> not support a wide-band deployment.

Thanks for the free opinion but offering "sanity"? Translation: naysaying. If you were truly objective then say why. Then we'll solve the problem. There is a way around every road block.

Listen people. An invention means something that we previously couldn't do! That is where wisdom enters in and what I'm saying about knowlege and what we think we know.

> Even Stewart promotes MURS
> as an alternative to ARS only to avoid content restriction and tap
> into lower-cost consumer equipment.
>

Don't put words in the mans mouth. Why do you promote wasting money? I don't think he promotes MURS over ARS persay. Neither do I. Simply stating their pros and cons only shows they are not equal.

I love ARS and it's pros. I think we need more of them. I may use MURS advatages and have no childish notion of disertion for doing it. Why do you. Don't you know they have near the same scientific characteristics? Many of the lowest cost and best radios do both "bands". That "band". Why start a holy war over it.

I said....

Oh please! I thought you were just missguided. have you ever heard of privacy. Let me be frank. Those with that opinion are haughty and foolish. As to my credibility, it's not up for a vote. Is yours? You don't really mean it do you?

Now, I do think we need to be responsible with anonymity. I am.

I'll only say this...

Ben Franklin (great inventor) said some thing like....

If you give up part of your privacy for security you may find you have neither. One could factually RESET your computer. Don't you know about security updates?

The key is that Metricom has figured out a scheme for deploying such a network over a very broad area. They're already doing it, and, yes, it costs money.

> I do know you missed the glaring point. My idea has no middle man. It

How APRS works? A moderate handful of high-level digipeaters and a lot of nodes that transmit a lot.

Could you elaborate on the "low cost radio computer combo" ? I assume this means a radio connected to a computer, not a device which integrates a computer and a radio into one consumer-ready unit?

> Have *you* heard about the modified wirless LAN cards? That's if you

Sure, I've heard of these things. Peer-to-Peer (aka P2P) is a big buzz these days, but most of the concepts have been around a long time, and most of the "P2P" plays ultimately have a server somewhere to aggregate the "peers".

Certainly, IP networks have long enbraced the notion of robustness.

Why should anyone share their network connections (particularly when the network connections are provided pursuant to terms-of-service/acceptable-use-policy which prohibit such sharing?) ?

I remember the hey-day of packet radio quite well, it wasn't that long ago. A lot of hams put systems together and put them on the air, and shared them - as long as it was fun and interesting. Then, one by one, they started losing interest and turning the equipment off. In the area I was living, we had a BBS operator that worked diligently to avoid any competition, put a lot of radios on the air and worked through the BBS organizations to make sure he had the only game in town.

One day, he lost interest and turned everything off, and that turned off a lot more than his own activities.

That's what happens when you depend on volunteers. When it stops being fun, they stop playing.

I'm not nay-saying, I'm pointing out a reality.

> It could start with small local networks (ie your neiborhood). It could

I suppose I was providing that service at 2Mbit/s before anyone cared ;-).

> Now will your take these idea's to your supervisior and make them a
> toll (paid) monthly per minute charge? I don't care because I will
> create with freedom.

My supervisor! There you go talking about my job, as if it somehow motivates me to denigrate the notion of "free wireless networking".

I won't take your ideas anywhere, because they're already in deployment, certainly in the Metricom architecture. Have a look at:

http://www.metricom.com/ricochet_advantage/tech_overview/index.html

I *love* the idea of wireless networking. It's a fabulous thing, indeed. It's been over five years since I built WaveLAN drivers for my Unix boxes and, only recently after moving, have I not had a 2Mbit/s network operating 24/7.

Nope, I'm not trying to prevent some kind of competition, not at all.

> There's a big difference in saying that we'll have to work around a
> given obsticle and simply harping we can't. This during our whole
> process of hard work, synergy and God given creativity.

What's the obstacle you perceive? Scalability? Reliability? What is your goal, free wireless network access?

>

> >
>
> First you brag on comercial full-duplex and then you ask this. Don't
> you know. It depends.

I do not recall "bragging" on anything, much less "commercial full-duplex". I'm asking what "full-duplex" has to do with the network. Do you mean full-duplex data radios? Do you mean full-duplex IP telephony? I don't know what you mean.

> > > Use $20 FRS rigs.
> >

> we don't need a TNC anymore. Also, like I'm saying; we could write any
> wirless protocol for a soundcard. It's a DSP. Soundcards are $20 NEW!

Of course I've heard of the sound-card data implementations. They're pretty neat at 1200 baud, and not the hardest way to do 9600 baud.

Of course, those $20 MURS radios won't support 9600 baud in the limited channel spacing and transmit/receive turn-around common in inexpensive PLL designs.

Are we talking about a 1200 baud RF network built with off-the-shelf radios and using sound-cards? Hams have already tried this and it didn't exactly catch on. I'm not nay-saying, I'm observing recent history.

> > > Make it as fast as commercial robber-barrons at no charge. Hey mabey

> > How exactly do you plan to do this on the cheap?
> >
>
> I knew you'd like the idea. Voice encoding can now be done at LOW
> speeds like 4800b. Don't you know that?

Of course I know that. However, you're not going to get anything even remotely close to "full-duplex" 4800 baud with $20 radios and sound-card modems, that's been my point all along. I don't know how you plan to work hard and cleverly work around the physical limitations.

> > > USE MODIFIED equipment. Like the wireless LANs for EXAMPLE. Use

This sounds like packet radio all over again. Perhaps you could do it better?

> > > I don't know. Do you think it's possible to build somthing new? Why

>
> Great then. Let's do something new.

Right then, would you like to discuss something new? So far, I haven't heard
anything new. $20 HTs attached to some kind of modem (TNC or sound-card,
doesn't matter), networked via landline systems. I don't mean to nay-say, but
this not anything new.

> > Stewart's idea for MURS-based
> > wide-area data service fails even the grossest sanity check, that's

> help with. Naysaying isn't and idea.

What exactly is your idea?

Deploy low-power wireless network adapters, perhaps attached to
landline networking? Metricom is a commercial venture doing this.
Hobbyists have done this as well.

Those $20 HTs don't permit a high-speed network. What's the alternative?

> > Why do ask about my paycheck? Are you intent on impeaching my
> motives?
>
> I'm not being nosey. I just can't understand your motive. Are you
> trying to appear inteligent?

My motive was something like "help a fellow enthusiast avoid banging
their head against a problem that's rapidly being overcome by consumer
devices". It is really an altruistic motive, perhaps I'm being misunderstood.

> > Here's a clue: mobile wireless data is already a large market. I'm

> > NTT Docomo, GSM, Sprint, Palm.Net.
> >
>
> ...all which charge out the wazoo and have poor coverage. Translation,
> they're wirless "solutions" have bugs (problems) too.

Ah. Now who is the nay-sayer? I believe this is where we fundamentally
part logical ways. I'm not worried about appearing intelligent, and I thought

I had something to offer in helping you appear intelligent. In your broad
dismissal of the existing commercial wireless deployments, we're no longer
on the same page.

I recently drove from near Napa Valley to Los Angeles. At no point was
I ever outside 9600 baud full-duplex data coverage. Not once. Sure,
it costs money, but *it works*.

> > For starters, have a look at http://www.AnywhereYouGo.com/

>
> So anything new or that needs ironing out is half-baked? Well I guess
> anything "baked" was half-baked before hand. Do you take your cookies
> out of the oven when they're half-baked and throw them out too?

Observing that something is half-baked is part of understanding that
it needs more cooking. I believe you're annoyed that I'm not helping
you cook your idea. Well, I *really* am, when I offer links to resources
on current wireless networking technologies, I'm trying to help.

When I think about what you're proposing and carry it through to the
ultimate conclusion, I end up with something that looks a lot like
Ricochet implemented by hobbyists and volunteers, and I don't
believe this is (a) new or (b) practical.

Not only is cloning Ricochet not new, the volunteer aspect makes it
completely unreliable. Once it stops being fun, people will turn their
nodes off.

> Do you see when an idea is "baked", then your basicaly done creating
> it. It's not an idea then. Don't rag on peoples ideas. It's imature.

I think I have some decent wisdom to offer here. Are you really suggesting
that I'm immature?

>
> I don't think you WILL get it. Open source works. It's a different
> persective. You're suppose to be good at that. Remember? Why don't you
> get it?

Open source, Linux in particular, became the rallying-point for those
businesses intent on unseating Microsoft's dominance. Investors
viewed it as the "Next Microsoft" - i.e., the Next Big Thing, the next
huge cash cow.

Investors have run out of patience with Linux for the most part.

At least one commercial Unix vendor is already making their
supported products available under a version of an open source
license; see http://www.sun.com/dot-com/software/free.html

Why is Sun doing this?

What I "get" about open source efforts is that they work well
as a tool to gain mind-share and ultimately sell hardware. There's
a persistant hope that open source efforts will eventually lead to
the sale of services, as well.

Fundamentally, my issue is that volunteers are not reliable enough.
Help me understand how to solve that problem. It's not a technical
issue, though.

> Listen people. An invention means something that we previously couldn't

I'm not putting words into Stewart's mouth. Go back and read his note that
started this thread. Stewart stated his view of the pros and cons and declared
MURS superior.

> I love ARS and it's pros. I think we need more of them. I may use MURS
> advatages and have no childish notion of disertion for doing it. Why do
> you. Don't you know they have near the same scientific characteristics?
> Many of the lowest cost and best radios do both "bands". That "band".
> Why start a holy war over it.

I'm not starting a holy war of any kind, though I sometimes suspect Stewart
is intent on doing so. Would you please explain what "best radios" means
in this context?

> I said....
> > > The begining of knowlege is knowing you don't know everything. Next

> > aimed at me.
> >
>
> Apparently not.

Hey, perhaps I was a little forward in this statement. Please forgive me
for any undertone of personal attack. I simply don't think you're giving
enough attention to how the commercial wireless community is solving
the same problem you seem to be working on solving.

> > I'm fairly aware of what I don't know, and I'm quite aware of the
> > dangers of limited perspective, exactly what I was trying to help
> > *you* with.
> >
>
> Explain to me what you don't know. :)

What I don't know vastly outweighs what I do know. Sometimes
I wish I was 19 again, because that was a time when I thought it
the other way.

> > Something else: if you want to gain even a modicum of credibility,

I sign my real name to my posts. You don't sign your posts.
My reputation is associated with my words, your reputation
is safely hidden from your words.

> Now, I do think we need to be responsible with anonymity. I am.

Sure, you're a nice guy. Too bad you're anonymous.

> I'll only say this...
>
> Ben Franklin (great inventor) said some thing like....
>
> If you give up part of your privacy for security you may find you have

> security updates?

Of course I know about security updates, and I know exactly what
my posting headers advertise. Frankly, I think you're overstating the
risk. Anyway, we're both advertising the same things about our
computers - we're both dial-up customers, one with PacBell and
the other with Mindspring. Maybe I'm just more comfortable with
my IP security measures here.

What grudge could you possibly hold against me? Well, in any case, I'm glad you
don't hold one.

I couldn't think of a more succinct description of exactly the issue
that I've seen, as well.

Hello David,

Please do NOT use the connector you mentioned, this is not correct.

Setup however is very easy indeed.

On the back panel you will find the phone jacks "AF OUT" and "PATCH IN" between
the "KEY" connector and the "13.8 V DC" connector.

These are the ones to use.
Simply run one shielded cable from from computer soundcard "output" to
"PATCH IN" on the FT990 and another one from soundcard "line in" or
"MIC" to "AF OUT" on your FT990.
No additional hardware or attenuators are needed.

Please open the volume control on your computer (usually the loudspeaker
symbol on the bottom right taskbar).
Make sure that in the playback screen everything is "Muted" except
"Wave" and "Volume Control"
On the recording screen, which is accessible through "options" an
"properties" make sure you only select the input used. (either "line in"
or "microphone" depending upon the input connector you used on the
soundcard)
Put the appropriate sliders about halfway to start with.

Start your PSK software, I prefer WinWarbler or Digipan and make sure on

transmit that you adjust your "MIC" control on ur FT990 such that your
ALC meter does not show any activity while at the same time giving
maximum output power which should be not more then 50 watts (setting by
the RF PWR control on ur FT990)
This requires some switching back and forth of the meter swicth to check
both output and ALC but is very important as otherwise you are
overmodulating and splattering all over the band.
ALC activity should be checked regularly especilaly when changing bands
or antennas.
If the "waterfall" display does not show enough activity then increase
the setting of the playback volume slider in the computer volume screen
as per above.

This setup works perfect and has been used by me since the beginning and I
already made well over 700 contacts.

Good luck and please look for me on the bands, see below.

> this not anything new.
>

Well you kinda are. First you say you want something that's realistic then you say it's nothing new. Well the lightbulb wasn't realistic until it was invented either. Still it wasn't the "light bulb" as we know it until it was accepted for it's COST EFFECTIVE BENIFTS.

>
> What exactly is your idea?
>

That we might be free. Real cost effective comunication benefits. Free stuff. Yea, that's right 100% free. Linux is free. That doesn't mean it's worthless. Of course there are hardware costs typically but it's possible for them to be less than a good dinner out! That's why I reference the AGWPE.

http://www.raag.org/sv2agw/

> it costs money, but *it works*.
>

The same high demand for cell phones could be driving a free public network. The demand is for a benefit not for desire to pay through the nose.

> I believe you're annoyed that I'm not helping
> you cook your idea. Well, I *really* am, when I offer links to
> resources
> on current wireless networking technologies, I'm trying to help.
>

Perhaps you could summerize a possible solution the problems.

> ultimate conclusion, I end up with something that looks a lot like
> Ricochet implemented by hobbyists and volunteers, and I don't
> believe this is (a) new or (b) practical.
>

Thanks for your opinion but this is naysaying. Practicality comes by design. As I'm tring to point out. It's not done yet. So what.

> Not only is cloning Ricochet not new, the volunteer aspect makes it
> completely unreliable. Once it stops being fun, people will turn
> their
> nodes off.
>

What do I have to do to explain? People will rally around benefits.

> that I'm immature?
>

Is it wise or immature to point out problems incontructively? Is it wise to suggest things are going to be the way they are just because that's the way they've been?

> What I "get" about open source efforts is that they work well
> as a tool to gain mind-share and ultimately sell hardware. There's
> a persistant hope that open source efforts will eventually lead to
> the sale of services, as well.

>

Well that's one way of looking at it. What Linux needs most is cost
effective benefits over Winblows. It needs to have the BENEFITS of
Windows and then more of what Linux does best. But that's a
whole 'nother story.

> > Thanks for the free opinion but offering "sanity"? Translation:

> > the problem. There is a way around every road block.
>
> Fundamentally, my issue is that volunteers are not reliable enough.
> Help me understand how to solve that problem. It's not a technical
> issue, though.
>

No, it's not just a tech issue I agree. Fundamentally, my point again
is innovators will rally around real world cost effevtive benefits.
Linux is the model of WHY it works. That is fact.

> > Listen people. An invention means something that we previously
> > couldn't
> > do! That is where wisdom enters in and what I'm saying about
> > knowlege
> > and what we think we know.
>
> What are you trying to say here?
>

That anyone can balk and say it can't be done just because it hasn't
yet been invented.

That we learn a scientific principle and wrongly think revision of that
perspective can not be accomplished.

That we fail to realize innovation also includes working around
roadblocks.

Too many indians and not enough Cheifs.

That true wisdom is more than persective. It's more than vision. It's a
new vision. It's creativity. It is innovation. It is future, not
past. It is forward not back and not park.

Sure look at the road block. Don't worship it. Think positively. Don't
condem effort. Dare I say, have a little faith.

RF is a God given physical thing. Great innovators have devised a way
to span great distances at the speed of light using RF. That doesn't
mean we fully understand electromotive force. It's a Godly force
greater than atomic force (physicists confirm). It's a great mystery.

Don't think innovation with RF is over by any means.

The real benefit is we can comunicate mind to mind over great distance
any time.

> Stewart stated his view of the pros and cons and declared
> MURS superior.
>

That's an inaccurte interpretion. A spin. Ask him.

Also I think he was just saying one way is to start simply. He asks a
wise question about text base ideas. Can we get a benefit at lower
speeds? Is it cost effective. (look at APRS)

> > I love ARS and it's pros. I think we need more of them. I may use
> > MURS
> > advatages and have no childish notion of disertion for doing it.
> > Why do

> > That "band".
> > Why start a holy war over it.
>
> I'm not starting a holy war of any kind, though I sometimes suspect
> Stewart
> is intent on doing so. Would you please explain what "best radios"
> means
> in this context?
>

The newest.
The most cost effective.
The most modern features (the ones with benefits like speed dials).
The best distance (cost) vs. penatration (in buildings) balance.
Very versitle. Air/2m/MURS/Police/Fire/Weather or much more.
Cheaper feed line (if needed).
Cheaper antennas.
More that many already have.
Dual use (2m Voice/simplex/Repeater/autopatch/Packet/MURS/New stuff and
more).

>

Please forgive anything I wrote which you may take as condeming too. We
can disagree. That's good. That promotes solutions. We shouldn't
condem, that's evil.

I/we all need to look closely at innovations in the commercial wireless
arena. Agreed! They have learned much from Hams. We can learn where not
to reinvent the wheel. Agreed.

> > > I'm fairly aware of what I don't know, and I'm quite aware of the

No. It's wise on the internet and my words still speak for me and my
character. In what I say and in what I don't say. I have no fear of
man. It is God what makes me quiver. Thankfully for me, he is
forgiving. That is true love.

I am impressed you so far do not go off the deep end with childish
insults and flaming attacts to avoid a point made or answered. That is
mature.

Perhaps this disscussion is truly helpful to all. Let's make a better
world one station at a time. :)

I have only just set this up and it seems to be working well.
Thought if this continues, I may set one up for our hobby.

What do you think?

I agree with everything Rick says. RckRtty is a fabulous product, and the
product of choice if you run Windows ME with a PTC-II. However, the moment
PKterm is compatible with the foregoing, I intend to give it a try. RJB.

Could anybody provide me with a reference for how cell sites interconnect and handle soft handoffs? One book that somebody recommended was CDMA for Wireless Personal Communications by Ramjee Prassad.

Should I buy the IS95 standard?

Thanks,
Chuck

For sale: AEA PK-96 dual speed TNC.
Does 1200 and 9600 baud on the same radio.

$140 shipped to lower 48. For more info send email to
ZZZjim_cronin@juno.comZZZ (remove leading and trailing ZZZ).

Thanks and 73,
Jim

This code is kind of ugly yet, but it may help others working on the same thing. Basically it connects to a distant (or local) AGWPE via TCP/IP and puts everything it hears over the radio port into the MySQL database. A pass-2 daemon (not created yet) will then extract data from the frame table to build a filtered table. A pass-3 daemon (not created yet) will then actually decode the data. Critique welcome (I'm not sure all the IP fragment stuff is necessary, or done right).

It does load the table...

>without interfering with the other allowed modes (weak signal & repeaters).

False. We have been operating a duplex 56 kb digital repeater system here for several years. It is 222.4 MHz in and 223.85 MHz out, located on Sweat Mountain north of Atlanta. Fully coordinated by SERA. Most of our user access switches are on 70 cm, but this 1.25 m hub has served its territory very well, and was chosen to avoid a serious 70 cm interference situation that exists on the mountain.

>No
>one has been permitted into the 219 segment due to intereference issues with
>the primary licensee of that segment. If it is in fact being used, it's
>certainly not coordinated (and for the 219 MHz segment, coordination is
>required for the transmission to be legal).

False. We have been using 56 kb coordinated channels in the 219 MHz band for point to point network links since shortly after the band became available. The ARRL handles coordination of this band between amateurs and the inland waterways radio service. The band is divided into 10 100 kHz channels (which acomodates our 70 kHz wide 56 kb MSK signals, and provides a guard band).

We've yet to encounter a location where at least some of those channels can't be

coordinated for amateur use (typically we can use all but 1 at a particular
location).
There is so little use of this frequency range that we've found that very simple
bandpass
filtering is usually sufficient to avoid the IMD problems we often have to fight
on our
70 cm high sites. That makes it an excellent choice for network links in and out
of
the RF congested high sites we use for our user access points to the network.

The local packet guys around here, apparently, tried to get 219Mhz channels allocated,
but apparently, in the SF Bay area there's a commercial service, that uses one frequency
in the band, that has the authority to block amateur access to the entire band. I think
it's some kind of marine telephone business -- or something like this. I recall, someone
made a petition for a rules change, that if we could demonstrate that we wouldn't interfere
with them, we should still be allowed on the band, but I'm not sure if any progress was
made on this.

My thinking is that hams should try to get on these channels, if at all possible, to
establish amateur use of them.

Here's a summary from Metricom's web page:

http://www.metricom.com/ricochet_advantage/tech_overview/index.html

> > That's what happens when you depend on volunteers. When it
> > stops being fun, they stop playing.

Beneficial motivates few once the novelty has worn off.

I believe you're over-applying the Linux analogy here. Linux source code may be freely shared, but that's just software and not a service. A wireless network as you propose is a *service*. People will need to actively contribute time and money to keep it going.

I can write a bunch of code, get it working enough to satify myself, and then give it away, without ever spending another minute or dollar on it. Practically speaking, I can't ever "turn off" the code that I wrote. In engineering terms, I can contribute my NRE without promising anything else.

Suppose I volunteer to provide a wireless network node. I have to pay for equipment, electricity and Internet access, as well as maintain the node. The day that I'm not interested in it, I can turn it off.

Free source code does not equal a free service.

Steve Sampson has a practical observation about this himself.

They supposedly have done test links. There are a few links operating in some australian cities, IIRC. And supposedly there is an english net that has a few links going.

And of course there are the commercial ISPs. One in Iowa was written up pretty broadly a year or so ago (ruralnet?). One near me is doing pretty good for a few people, but they are having a hard time getting enough coverage to sign up enough people to make money. (bigskytel.com)

That I think will always be a problem for a commercial venture. It think the co-op style has more potential. But they are not without their own problems... Siting for the base links, and cost/convenience per node. Right now the tradeoff for a low cost node is low convenience, which limits the locations available. I've been doing some preparatory experiments, and it looks good to set up a wireless link between my brother and myself (several miles).

And once a few links are fully operational, then more people are willing to spend the money and soon you have a net. The wired internet took 10 to 20 years, but the wireless city nets will be less (I'm guessing about 5 years). I don't know if they'll be low bandwidth cellular based commercial, or high bandwidth co-op style. But people want it.

You present a dichotomy between "low bandwidth cellular" and "high bandwidth co-op" as if these are the only options on the landscape.

I believe the dominant wireless players will be high-bandwidth cellular operators. Integration of telephony and voice, taking advantage of the economy of scale and providing highly-available service.
Think "3G".

Wired broadband will dominate the home market.

Good summary. I had heard of all that. Light pole node and all but it
is not in my area. It cost big bucks. I'd rather have my own hardware
than pay mouthly or nasty per minute fees. I don't wish to live that
way. I do want low cost hardware. That's what we're talking about.

My point here is simple. You would have said free software isn't
realistic either. But that's not true. I can put that free software on
low (to no) cost hardware and acheive real world benefits that cost

effectively beat anything else. Now it may be technical. I don't mind
that if required. Most Hams (or other innovators) don't either.

Of course the goal is KISS. The more technical persons help the less
technical. Yes, just as with Linux. Note again by the way. Linux needs
to be made more KISS.

Wouldn't it be great if the ARS took the lead in innovation back here?
Let the sleeping giant awake. We sure need to. We have the talent
perhaps we need the vision. See below...

>
> Wired broadband will dominate the home market.
>

I sure hope so. I too beieve (with somebodies innovation) wireless
higher speed will prevail. I'm just worried no one will be able to
afford it. Just look at the cable modem monopoly. Let's work on it
together.

My idea is like Metrocoms but also like the internet in that no one
owns it. Except your own RF station / computer.

What wrong with that? Especially with the Internet as a potential
backbone.

It just won't work in the "West."

Western countries are pure capitalists. There is some guilty socialism (probably should be "socialized" as the former term has a lot of weight to it anymore).

It is not accurate to say that no one owns the Internet. It has always been owned by someone. First government (military folks that needed to kill the enemy) and more recently, commercial entities.

Most people have "Internet" connections already. They have cable, dsl, and 56k modems, and this is adequate for them. Most people don't need pagers and cell-phones. They are pure expendable income "status" symbols. I almost feel sorry for them, as they are completely lonely without them. I once had a lady make 10 calls at the airport. She was sitting right next to me. On the 11th call I told her to put the phone away, or I was going to shove it up her ass. She had the remaining intelligence to move away.

Before you spend any money, ask all your friends if they would be interested in investing (long term) in a telecommunications company. Tell them you don't know how much it is going to cost in the end, but that it will be "real fun."

Report back on their investments...

Steve

Take a look at: http://www.radio-link.net/link.html

After 2 years I had three people willing to invest the $1200 per node.
This price is moving up, not down. Reliability is the key. Sure you
can jury rig something cheaper, but time is money, and what you
save in equipment, you can double in maintenance.

Steve

That sounds much more complicated than necessary, unless I am unaware of some other factors which required Nielsen to achieve distribution to such a small focused group of viewers.

Local TV station network affiliates rather routinely "roll-in" (or "cut-in") alternate content in place of individual commercials which are included within network programming delivered to a particular market area. As you suggest, this could be a different commercial for the same product or else for a different product when the advertiser wishes to do so. Or sometimes they will roll in an unrelated commercial, or even a PSA (Public Service Announcement) or SPA (Station Program Announcement) if they cannot sell the spot although this is rather unlikely during primetime network shows.

Perhaps this is also done nowadays to some extent with CATV local insertion although most of those systems do not seem to be that sophisticated. An exception may be centralized operations in big markets like NYC, I'm not sure.

I'd be curious in any event to learn more about this MarketMakers system.

Frequently, surplus equipment from failed or discontinued commercial ventures ends up being used for another purpose. For example, the DowAlert (sp?) SCA-FM receivers which were donated and retuned to receive subcarrier radio reading transmissions for the visually impaired.

However, I imagine that too much stuff just goes to the scrap heap :-(
Kind of sad.

That same station also has blocked Southern California, Oregon, and Washington from access. I believe that Nevada, Utah, and Idaho have also been blocked by that user (due to elevation issues of the western slope of the Rocky Mountains), but I'm not certain.

Many of the "great lakes" states have been blocked by users related to those waterways, and supposedly the same with Mississippi River waterways (and tributaries).

If this has been allowed in Georgia, it's the exception; not the rule.

Many thanks for your post and to others for their newsgroup responses.
I have been slowly going through my programs trying to find out which
one was causing my time to go into the 24 hour mode. As a patch I even

resorted to putting a Regional Settings icon on my desktop.
73,
Pete

That's a very good point. Watching time verses money is wise. I'm
talking about something people want. At least something technical
persons want. At a more lower cost. Like some Hams and some computer
users.

For example in basic slow packet ; I can set someone up in no time at
all with their 2m, Computer (W98) and Soundcard running AGWPE for a
TNCless node using almost zero ADDITIONAL dollars. Maybe $2 at rad
shack for 3 components. Check your junk box. Others can just by a
interface like Bucks' for $20 if you can't solder.

Your blanket prediction of demise; I disagree with. If you apply the
same logic. There would be no ARS.

If you give up innovation and leave it all up to commercial services
you will be over charged. Do you see my point? You are at their mercy.
By the way there stuff "ain't" perfect either.

LOL! The digital age has brought many challanges with it. Don't get postal on us now. People should indeed be considerate about the use of comm devices. Had she been talking to a person next to her though, it wouldn't have been much different.

Vibrate mode is the real answer to personal communication curtesy.

I am NOT talking about just "fun" or just "hobby" benefits. I do not think ARS is JUST a hobby. It can be fun and a hobby but we need real

world cost effective benefits. Like using the autopatch to see if my
wife needs milk and eggs. Why pay cellular services for that?

Can't we come up with some new stuff?

We need real world cost effective benefits!

That would be nice. But I haven't seen it or prototypes of it.

>Wired broadband will dominate the home market.

Population wise, almost definitely. Kind of like (do I dare bring it up?) the U.S. presidential election, where even though gore got about 50% of the people, he won only 10% of the land area. The 50% of people that don't live in big, high density cities want broadband also, but the economy of scale just isn't there to run fat-pipe wires around.

And the same holds true of the world... Many developing nations do not have wires. They skipped wired phone and started with wireless. That wire infrastructure costs too much per mile if you can't sign up everybody. So they go wireless.

If the cable companies and telco's don't get off their butts and take advantage of their wires, people are going to go with wireless internet (either groundbased or satellite). Once they experience always on broadband connections, they want it.

Yeah, this is the $64,000 question. Everyone seems to be converging on a vision of cell phones where people walk around little boxes they can browse the web from, and watch little movies and do all sorts of high bandwidth stuff. You know, Dick Tracy watch and like Austin Power's little TV that he has in his dashboard -- the whole bit. But, like, uhh, excuse me, seems like there are some nasty technical issues here. And, I agree there are some super smart people working on the problem, but sometimes I wonder if we'll end up with another HDTV -- where it seems the emperor really doesn't have any clothes. Really.

I guess if the high bandwidth cell phone doesn't really work, it'll be another HDTV disaster -- only times 100. Cell phone might have the advantage that the companies have some incentive to make it works -- whereas the TV networks would just as well have HDTV die a quick death.

Of course, digital ham radio seems to suffer from some of the same expectations. We hear it here all the time from the 'Why doesn't packet run at 10mbps' crowd.

Actually they don't - because they don't have anything working.

Well, Steve, it's looking like this might end up being practical
afterall; AO-40 has begun shown signs of life again.

Yes, and on S-band. When the U and V transmitters turn out to be both lost
(this is still far from certain!) we might see a quick migration to S-band.

Rob

optimistic but IMHO wrong.

Given the prices of telecom infrastructure, and market demands for short-term profitability, there will be at most two high-speed access providers in a given market.

Most consumers are willing to spend only $30 to $40 per month on high-speed Internet services. This price sensitivity was created by experiences with dial-up and marketing from cable modem providers.

At that price point, most broadband services are running at a loss and aren't even covering capital equipment costs let alone personal salary and bandwidth.

The numbers I've seen for fiber plants state that it costs roughly $1000 per home passed. If there are approximately 4000 homes such as there are in my locality, the fiber plant alone will cost at least $4 million. Assuming a 30 percent penetration (1200 homes), you will get approximately $48,000 per month revenue ($40 per month).

A T3 pipe is probably the minimum one could use for this size population and would run approximately $30,000 per month.

people costs would probably run about $50,000 per month (technical support, engineering, network and server administration)

So, from the get go, you are at least $4 million in the hole (closer to 5 million if the cable modems are subsidized), you have a monthly run rate of $80,000 per month.

If you only have a 30 percent penetration, you are losing $32,000 per month. If you have a 60 percent penetration (2400 homes), you are making $96,000 which gives you $16,000 per month to pay off your capital plant. This means you can pay off the plant in 250 months or 21 years.

What does this have to do with wireless? If you follow the same model, you will see that as soon as a second competitor arrives, neither player can pay off their capital investment. You need a monopoly ownership of the market in order to recover capital expenses.

While a wireless plant is cheaper than a fiber plant (roughly $500,000 to $1 million per cell), it reaches a smaller number of subscribers, has almost as expensive bandwidth requirements, plus has a much higher initial outlay in terms of the license costs from the auction.

given the economics as I have outlined them above, in urban spaces you'll see maybe two competitors for high-speed data services. In suburban and rural spaces, there will be at most one player. It's highly likely that a single player will in a market will discourage any other potential competitors from entering that marketplace.

personally, I would love to see more competition in the telecom space but unfortunately it isn't going to happen. We've split our infrastructure the wrong way and not recognized the natural monopoly aspect of last mile and regulated it as such.

All Motorola handhelds come with rebates if purchased before the new year. The MV11C can be picked up for as cheap as $139 including shipping - that's $109 after the rebate! Here is one site that I've bought from before:

http://www.motorolatalkabout.com/radiosplus/businessradio.html

The MV11C is capable of operating on two MURS-compatible frequencies: 154.570 and 154.600. It is a 1W radio, and has a removable antenna.

Unlike FRS, with MURS external antennas are allowed, and you can do digital communications! Also, unlike the Amateur Service, you won't have a bunch of old windbags telling you that it is "illegal" to set up a network of Internet Radio Gateways for our portable laptops/PDAs. Plus, the 2W ERP limit of MURS is a blessing, it will promote frequency reuse - unlike the virtually unrestricted Amateur Service, where multiple blowhards would render standard frequencies useless with their 100W hilltop transmitters(get ready for 'em to squeel!).

MURS is the latest license-free radio service - check it out!

Stewart, I have read your postings in this general area for some time now.

I am consistently amazed that you even bother to list your ham call. I have seldom see an amateur run down amateur radio the way you do, and for such evidently narrow reasons. Most hams tend to follow the FCC regs, like them or not. That should not condemn them to the derogatory discourse that you seem to enjoy inflicting on this and other newgroups.

I guess that I just don't understand . . .

Before you run up the flag in Motorola's behalf, you may want to review the petition for reconsideration they have before the FCC currently to remove the MURS rule from the CFR. The comment period opened today.

There's also a petition to re-instate the 20 WPM morse code tests.

Once the FCC has done something, a reversal has a snow ball's chance
in hell.

I don't understand why you posted this to an Amateur Radio
newsgroup?? Could it be that MURS will only attract white
people? But most of the white people who buy these radios
will only put them in their bomb shelters for possible future use.

I am sure the PRSG would benefit from your positive attitude.  They are not
quite as optimistic.  When you factor in the difference of money backing the
requests of Motorola and the request for reinstating 20 WPM, you begin to
see where their pessimism originates.

Let alone the fact that when it comes to amateur radio, Stewart has
demonstrated that he is still pretty clueless.

This is an excellent idea and good thinking. This is the kind of
thinking needed to improve Ham radio. I'm discussed with the manner of
these other replies.

As it is, if we need to try MURS to get a BENEFIT, then that's what we should do. The thought of the 2W limit being a potetial benifit is a wise one. Whether or not this idea plays out successfully or not, it represents the true scientist and inventor. Something I'd like to think is the very nature of Ham Radio. If us Hams can't take the heat we need to fix it. If you love Ham radio (as it is) and you see no need for improvement then fine.

I love Ham Radio and DO see a need for improvment like say, a REAL BENEFIT! Right now the autopatch (reviled by many fogies) is the best thing we've got going! Stick that in you HF hat and smoke it. HF is cool but I'm not into it. If you are, that's OK. I like clear always working communications and certianly don't want to pay a high price for it. If you have too much money invested in Ham equipment then don't come bitching about it. Do something productive. I believe in obeying the law. I also believe the FCC regs may need some upgrading for our benefit. That is up to us. That is what we need to do. If we don't, no one else will. Ham Radio will suffer in it's numbers or die out with it's old gaurd unless we change. Why do you think most new Hams get a 2m HT as their first rig? I think we need to get back to basics while embracing and enhancing new technology. We need communication benefits! It's that simple. That's the whole goal. We need rules. We don't need to be disabled. We need to know that our knowlege of radio and science is nothing without real world benefits. Beyound this we need to care for each other while using these communication benefits. That's the only thing that shall last.

If you don't want to use the Motorolla radios then don't. It was just his suggestion because it is already for MURS frequencys.

As to the idea. Speed will be the gratest problem. 9600 baud (which takes up less spectrum than 1200) would be the cheapest per speed. Rigs would need access to the discriminator or have a (really) 9600 ready rig. It would be worth it to promote 9600 as a *minimum* I think. DSS would be best but not on MURS.

The super cheap might use 2400 or 4800 baud with unmodifided rigs. But at 9600 one might start to think about HTTP. Further the benefit would seem to be only for mobile/portable ops. As the home station could use the regular internet. So your equipment at home could be basic but the mobile needs special consideration. Perhaps your own mobile text (2-way) pager. It all depends on what your going to accomplish. That's why I say "BENEFITS". Maybe we could get hold of those small 2-way paging type devices with it's own thumb keyboard and email capabilites. Then set it for MURS. Your home computers soundcard can encode/decode 9600 AX25 so why not other protocols. This sure helps in the cost effective area. Once those Palm/CE devices with hi-res color video LCD screens come down from prices around $500 then very interesting wirless benefits come to mind. Modifying low cost equipment seems to be the best solution in todays micro circuit world.

The point is, we must consider the benefits, the costs and if the rules

need to be changed accordingly. We definately need the rules that
promote sharing but some of the reasoning behind current FCC regulation
is outdated. They will not fix it until the Ham community cries foul.
So far we've only agued about CW. That is way off target. it doesn't
matter. New communication benefits do. What idea's do you have?

How did you arrive at that conclusion?
(9600 baud spectrum usage less than 1200's)

A 9,600 baud signal requires 15.36 kHz of bandwidth (and thus, usually occupies a 20 kHz channel - to include a guard area against adjacent channel overlap). It's just too big for 15 kHz spacing without causing adjacent channel interference.

A 1,200 baud signal is encoded into a voice channel which needs LESS than 15kHz (when including its guard area). At most, it only needs to carry a tone up to 3kHz (audio passband), for which the higher tone used in 1200 baud AFSK easily fits within. That's why such may be spaced 15 kHz apart.

Minimum bandwidth of a digital signal is a question type that appears in the amateur radio question pool (extra class), so there's no excuse for getting this concept wrong.

MURS is not Ham Radio.
Please remove the cross-post.

Everything that MURS might "someday" be able to do is already simple using Ham Radio. Nothing new or exciting here, just the same stuff Hams have already done for decades.

The same way he arrived at the idea that MURS (if it ever does come
into existence) has something to do with Ham Radio.

i.e. he is probably a potential reseller of MURS gear trying to
scare up some future business with these spam postings.

> (9600 baud spectrum usage less than 1200's)

Just like 300W light bulbs use less electricity than 100W light bulbs.

> digital communications!

Which is one of the reasons the left over Batwing junk is worthless for
MURS.

> Also, unlike the Amateur Service, you won't
> have a bunch of old windbags telling you that it is "illegal" to set up

Legal as Church on Sunday -- so long as you don't mind sharing your
internet gateway with the existing users -- such as your local Mickey
D's drivethru -- and a few thousand other non-technical idiots falling
for this hype.

> Plus, the 2W ERP limit of MURS is a blessing, it will promote frequency
> reuse - unlike the virtually unrestricted Amateur Service, where
> multiple blowhards would render standard frequencies useless with their

Instead you get unscrupulous dealers trying to dump junk radios to
unqualified nontechnical fools.

> MURS is the latest license-free radio service - check it out!

You might consider reading Part 95 to find little things like the
strange bandwidth limits that rule out most existing Part 90 radios.
Then monitor the five frequencies to find out which flavor burgers you
can order on each one.

This was on 10m ???? I would think you would do this at 300 baud no?
is there really enough bandwidth for 10m for 1200 baud. Just curious

That is 1200 baud FSK, not FM/AFSK.

Bob

And 1200 baud is the top speed authorized for 10m for U.S. amateurs.  12m and
longer wavelengthed bands have a top speed of 300 baud.

WD6EHR's 9600 handbook lost the bandwidth as 12Khz - actually LESS than
a 1200 AFSK signal.

So, who do you trust - the ARRL question pool, or Mike Curtis? I think I trust Mike.

Now - let's get down to the real reason why 1200bps would be a good standard, at least to start with, on MURS. At present, you can't get plug and play radios to work at 9600bps(this is the same reason why 9600 never caught on with most Amateurs!). Besides, even if you mod a voice radio, you'll have to set the TxDelay so high that it won't be worth it. What we need are dedicated VHF data radios(unfortunatly, the inexpesive TEKKs are UHF radios).

Hi,

I gotmy TM-D700 last weekend.
It's working fine except two problems:

- Internal clock: I set the time to 17:45 - after 15 minutes it shows
28:00 - 60 minutes later 29:00 - 60 minutes later 30:00, 31:00 ...
The minutes are counted correct, only the hours-counter is wrong.

- APRS: I setup ARPS and it was working great. I saw different stations
and they saw me. Since today, I'm receiving stations datas, they get
digipeated by my TM-D700, but I don't see them on the screen!
Same settings as before.
I see the datas by watching "P.MON".
But no stations under "LIST".

Does anyone know anything about these problems?

```
Regards,
     Steffen / DO4OSS

Mike Curtis is wrong. Do the required bandwidth computation, and one comes up
with 15.36 kHz, which won't fit in a 12 kHz (or 15 kHz) channel.

9,600 + 1.2 x 4,800 = 15,360   - Mathematics does not lie.

Remember that the signalling rate is only 4,800 baud because two bits are
encoded per state.

It's more likely that you misread.

I didn't say that this exact question appeared in the pool. The formula is
needed to answer questions that are in the pool.

Same problems here. I bought my first TM-D700E last August and found the
same problem with the internal clock.
I tried resetting the rig several times without any luck. So I sent my rig
to the Kenwood Europe HQ via a local dealer, and
after three and half weeks I finally received a little updated rig, which
works FB. (According to the report, they just checked and
resetted the TNC clock there). - So, take contact with your dealer and ask
them to change your new rig or send it back to Kenwood for
repairs.
I have not observed any problems with receiving APRS-data: both the

APRS-data and DX-Cluster infos are OK on the "screen"

Hi ARi,

thanx for info!

3 1/2 weeks is a terrible long time :(
I will get in contact with my Kenwood dealer!

I wouldn't trust Mike's notes, most of that stuff is bent, spindled, and mutilated to be about "almost right."

Actually, you can find as many bandwidth formulas as there are books. The best way is to use a Bessel function chart. But even this is in the eye of the beholder and whatever acuracy you are crippled with. This entails finding the Modulation Index (3000/4800 = .625). This is either 4 or 6 sidebands depending on how good your eyes are or how close you get to 3 kHz deviation, or about (4 * 3 = 12 kHz). Bessel doesn't lie...

Actually, I e-mailed Mike, and he did say something, that when taken OUT OF CONTEXT, could fit what Stewart tried to say.

Mike said that in empirical measurement, there was negligible signal outside of the center 12 kHz with regard to adjacent voice channel interference, BUT that this negligible amount is still NECESSARY in order to correctly recover the digitally encoded signal. He also gave a different bandwidth function, which yielded a 15.6 (vs. my 15.36) kHz signal for 9600 baud.

The function I used is to find the MINIMUM bandwidth needed to transmit a digital signal of a certain baud and symbol rate. These other bandwidth formulae concentrate on other aspects of the overall transmission. All I need find is that there exists some characteristic for Stewart's assertion to be false to prove that his entire statement is wrong, and I have found such.

Yes, but as I said, that concentrates on a different aspect of the signal.
Your formula does not take into consideration the needed data throughput, and transitions per second (4800) is not wholly inclusive in representing that when each transition represents multiple states (not just two).

Remember, I started out by pointing to the general futility of trying to run better than 1200bps without a dedicated data radio(for low TxDelay, and PnP-ability). Even if we can't run 9600bps on MURS, I won't be heartbroken - 1200bps is pretty much good enough for the character-based PDA/laptop applications I'm talking about. Also, 4800bps really isn't that bad, if that is what our "real" limitation is. Also, look on the bright side - there is a lower BER at 4800 vs. 9600. Oh, and 4800bps is good enough to send encoded voice ;^)

But - once again, 1200bps is what should be used at first, anyway - as any old voice radio, such as a $109 Motorola Spirit radio, will be able to do it "right out of the box", "without a license", and without having to worry so much about the interference problems experienced on ARS - what with all the few ludicrous high-power NET/ROM radio-backbone nodes(instead of the obviously better alternative of using more lower-power Internet-backbone nodes - the "cellular" concept).

To get something started, we can use the old ARS TNC technology. But to get the ball really rolling, we'll need to chuck the old ARS TNC technology, in favor of a much cheaper PIC-based RF modem design, and move the software off the TNC into the laptop/PDA. The final icing on the cake will be cheap dedicated data radios capable of 4800bps(a VHF TEKK, if you will).

>beholder and whatever acuracy you are crippled with.

Bessel functions are usable when you have a single baseband tone no
matter what modulation index is used, but how do you calculate the
modulation index for such complex waveforms as average speech ?

In any digital signals the result depends on the quality of
premodulation shaping used and bandwidths are often measured at -26 dB
below carrier. Often optimum premodulation shaping can not be used,
since the eye-pattern at the receiving end may be too bad due to
non-optimal receiving filters or receiver and transmitter frequency
tuning error, so a non-optimal premodulation shaping may have to be
used.

Also you have to take into consideration the constellation used
(bits/symbol) and if self-clocking codes (biphase, Manchester etc.)
are used.

So you can not calculate the bandwidth from a very simple formula.

I think you're right here. The G3RUH modem is a complex signal, completely
unlike the two-tone modems of lower baud rates.

Since you can assume 3 kHz for the deviation, then the modulation index
will go up and down based on the harmonics of the complex instantaneous
signal. It is possible to gain a third sideband pair, but the amplitude of
this
component is a fraction of the other two sideband components (sorry my
battery died on the ole hp-48 calculator) and would be filtered. Paccomm
lists a 20 kHz bandwidth at -60 dB, and I think this is about right for 2
sideband pairs which is 19.2 kHz (+/-). This is only a ball-park figure
and your comment is below, is correct:

Man, my math is getting *real* bad...

Sorry, 4 * 4800 = 19.2 kHz

PacComm uses a 20 kHz at -60 dB bandwidth value in their sales material.

>
>

Well let's be clear here. I started this asertion. It was just a sub-point guys. The sub-point purpose was to dispel the myth that one can't or shouldn't use 9600 on VHF. Thank you for all the technical knowlege about exactly how accurate the above statement is but perhaps you (the guy who did it) shouldn't be so quick to berate me. Even if I were wrong (which I never am :)). I believe he said I should have known this from the basic Ham exam. That manner is what my main point is all about.

My main point in the first place is; we need to stop bickering about how much we know and get something (benefical) done. So the detailed technical arguements are only worth our time if they promote a real and cost effective *BENEFIT*. This is why I commend the gentleman for starting this thread and MURS idea. Perhaps we'd share more good ideas if people were not so attacked for giving them up in here. They are in fact gifts. Think about that. You know; synergy is taking differing idea's and putting them together for new combined idea's unavailable elsewhere or own ones own. This IMHO is what makes Ham (or MURS even) enthutiasts great. The innovation of days past is seemingly missing in todays Hams. Haven't you guys ever read about our great historical inventers and the resistance their "new fangled" idea created? We are overdue for or latest contribution folks.

Now, right or wrong (it doesn't matter) I put forth an idea. We were talking about moving away from the old ARS TNC and put the software on the computer using PIC (at the base station I suppose). Well think about the AGW Packet Engine (no PIC). That is, use the cheap soundcards. I think the new version 2000.77 has 1200,4800,9600 and TWO PORTS! So, that component may already exist for us and promote success. Also, all we need now is software of like kind that does our needed protocol. That is, if AX25 isn't successful.

Please, think cost effective benefits people. Expect resistance. Change the rules. Don't break the law. Let's be more open to suggestion in this forum. Except for naysaying, it's not only OK but often even great

to be wrong when problem solving. So, what's the problem? What benefit
are we trying to achieve? That's how things are invented.

Neither matters much, because the one thing everyone in this thread had
neglected in their research is bothering to read the FCC rules for MURS:

95.632 (b) The authorized bandwidth is 11.25 kHz on frequencies 151.820
MHz,
151.880 MHz and 151.940 MHz. The authorized bandwidth is 12.5 kHz on
frequencies 154.570 and 154.600 kHz.

If they actually read what the FCC has to say about MURS, and about
the status of the MURS service, we would not have this discussion.

It is totally unfit for any type of "cellular networking".

But some folks just want to sell radios ... whether they might
work or not ... so we get the recurrant SPAM about MURS.

In that case you could spend your time building Ham Radio networks,
using currently available 56k (and faster) modems and radios.

You could also help populate the HF network, so we have
bulk transport over long distances.

No, none of the above will run faster or more reliably than the internet.
It will, however, use Ham Radio ... the topic of this newsgroup.

Want to set up a link on HF?
I'm there, on air, ready to go, as are others in this area.
Willing to give it a try?

I don't think you're going to interest the MURS candidates.

The only attraction they have, is the complete freedom of unrestricted communications. Ham Radio is so restricted as to be of very little use. While you can have greater speeds, greater power, etc. You can NOT transmit anything (of value) over it without losing your license. I think you have to agree to this advantage before you can understand their side of the argument.

I think this extension of the CB service (which has existed defacto anyway) is not going to amount to much. The two Watts effective power is crippling. But...

...I can see all sorts of uses for a radio service that allows encryption. In looking at the proposed rules, I don't see a prohibition on this. Could this be useful to autos, boats, and 18 Wheelers.

Once again, you don't know what you are talking about, and you are being completely negative.

I do NOT sell radios - I simply pointed out that Motorola had a $30 rebate on MURS-capable radios until 1/31/2001. I am trying to provide INFORMATION on how to build an Internet-backboned VHF packet radio network.

What are you so worried about MURS for? Why are you always trying to stifle the spread of information about this new service? Could it be that you are afraid that I'm right?

You were always attacking those of us who wanted to build an Internet-backboned network on ARS, but now that there is a service where the rules clearly allow unrestricted Internet gateways(and there can be no argument), you call it "off-topic". Well, it is still "on-topic", because ARS can STILL be used for Internet gateways using the same equipement as used on MURS. The two are so close in capability that YOU CAN'T SEPERATE THEM.

Here are the major differences between ARS 2m packet and MURS packet:

ARS

License:
Technician exam(with $6 fee)

Max ERP:
1500W

Content:
Non-commercial - what this means is debatable. The conservatives believe that all content must be strictly monitored - and that only "they" can be the judge of what is allowable. Never mind that they allow the buying and selling of amateur equipment. Oh, and never mind that a voice repeaters don't have to be "monitored 24/7" - makeing digital information somehow more "evil" than non-digital. Actually these old PBBS operators just miss being able to play "God".

Antenna Height restrictions:
Virtually none - The ARRL lobby/lawyers are very powerful, and you can "get away with murder".

Maximum speed:
For 2m - 9600bps. In reality, currently 1200bps(you need to run dedicated data radios to get 9600bps with a low TxDelay - currently the

only cheap data radio is the TEKK available for UHF/70cm). You can run 56Kbps on 1.25cm/70cm, but the equipment is prohibitively expensive for the common man. You can run much higher speeds on 900Mhz+, but Amateurs (TAPR) are nowhere near implementing their own solution, and besides, the range/usability of these devices and converted Part 15 type devices is apparently "lousy".

MURS

License:
None required

Max ERP:
2W(better for cellular)

Content:
Virtually unrestricted. No "Gods".

Antenna Height restrictions:
Mainly limited to Municipal/CCR height restrictions. In flat/urban areas, it is better for the cellular concept that this is the case. Howver, in rural/hilly areas this is a negative vs. ARS.

Maximum speed:
Apparently 4800bps. In reality, currently 1200bps.

Here are the major differences between ARS 2m packet and MURS packet:

ARS

License:
Technician exam(with $6 fee)

Max ERP:
1500W

Content:
Non-commercial - what this means is debatable. The conservatives believe that all content must be strictly monitored - and that only "they" can be the judge of what is allowable. Never mind that they allow the buying and selling of amateur equipment. Oh, and never mind that a voice repeaters don't have to be "monitored 24/7" - makeing digital information somehow more "evil" than non-digital. Actually these old PBBS operators just miss being able to play "God".

Antenna Height restrictions:
Virtually none - The ARRL lobby/lawyers are very powerful, and you can "get away with murder". It someone tries to give you guff, you can "sue their pants off".

Maximum speed:
For 2m - 9600bps. In reality, currently 1200bps(you need to run dedicated data radios to get 9600bps with a low TxDelay - currently the only cheap data radio is the TEKK available for UHF/70cm). You can run 56Kbps on 1.25cm/70cm, but the equipment is prohibitively expensive for the common man. You can run much higher speeds on 900Mhz+, but Amateurs (TAPR) are nowhere near implementing their own solution, and besides, the range/usability of these devices and converted Part 15 type devices is apparently "lousy".

MURS

License:
None required

Max ERP:

2W(better for cellular). Blowhards can't "ruin" a channel over a 100 mile radius, as typically occurs on ARS.

Content:
Virtually unrestricted. Stock quotes, e-mail, newsgroup access, chat, FTP, Telnet, unrestricted commercial content. No "Gods".

Antenna Height restrictions:
Mainly limited to Municipal/CCR height restrictions. In flat/urban areas, it is better for the cellular concept that this is the case. Howver, in rural/hilly areas this is a negative vs. ARS.

Maximum speed:
Apparently 4800bps. In reality, currently 1200bps. For character-based laptop/PDA portable applications, 1200bps is good enough.

Actually, the maximum speed in the FCC ARS rules is 19.6bps for 2m (and 6m and 125cm). 19.2Kb is the closest, standard speed from a serial port. 56Kb is NOT authorized on 125cm.

You complain about us not knowing the new MURS rules. Why don't you know the ARS rules?

Dear Stewart:

Have you ever heard of "2.5G" and "3G" ?

While you're happily comparing MURS to Amateur Radio Service in your biased and subjective way (well, it's true), you're fixated on the "hobbyist" approach and completely ignoring what is happening in the real world.

"Consumer" wireless data is already well-ahead of what you're proposing, and on a fast-track to major expansion. Are you aware of the deal between NTT Docomo and ATT Wireless? Have you ever heard of i-mode?

Have you ever heard of Research In Motion? Are you aware of the recent CDMA license taken out by RIM? Do you know what Mobitex is?

Do you know what Java is? Have you heard of Java 2 Micro Edition? Does the Mobile Information Device Profile ring a bell?

How do you propose to pay for "RF Internet Gateways" in the MURS context?

I think you're making a lot of noise about essentially nothing.

Happy Holidays, though!

I was wondering when someone would assert that.  The concept
doesn't make much sense to me either.  You just can't
expect to do something like this with so few frequencies and
no dedicated frequencies. It's sort of like assuming you could
create an analog cellular network on CB and have it work despite
all the other users.

Martin

On the other hand, you have only very few channels available so you don't
need many local blowhards to ruin your entire band!

Yes - stuff doesn't work worth crap at those frequencies without dish
antennas.  For portable applications, you'll be lucky to get much more
than 500yard range without dishes.  Feedline losses are IMMENSE, so
you'll have to pay a pretty penny to get your antenna up high - or you
```

could put your radios in NEMA boxes on towers!

VHF is the best. Low frequency UHF is next best(FRS/GMRS would have been pretty good for this - if the FCC had allowed digital, as in MURS). Anything above 900Mhz is basically for building in-plant, in-house networks.

HF is for the birds.

Look, all this stuff is so much hot air. High speed wireless(with a decent range) is basically on hold until the FCC can work out the conversion of TV channels 60-69(low frequency UHF), and auction it off for billions of dollars - but this could take YEARS!

Besides, all this stuff costs money. There is a recession coming, and folks are gonna want a cheap way to "do wireless". Those folks that can get away with character-based applications on their laptops/PDAs do not need to pay so much money. The trick is to create the applications and infrastructure.

> How do you propose to pay for "RF Internet Gateways" in the MURS context?

Linux boxes are basically free, and many people already have Cable Modem or DSL connections - even a NetZero(free) connection will do. All you need is a $109 radio, a $40 surplus TNC, and maybe an antenna and feedline if you're not on a hill.

> I think you're making a lot of noise about essentially nothing.

I never complained.

> Why don't you know the ARS rules?

HAH! 56kbps IS ALLOWED ON 1.25cm!! AND, IT IS BEING USED ALL THE TIME
BY THOSE THAT ARE IN THE KNOW!

As far as me stating that the maximum speed on ARS as being 9.6Kbps -
that IS the fastest speed that anyone really ever used on 2m, and you
KNOW it - nevermind what the rules say! Anyway - I know the rules
better than you, as you just proved by sticking your foot in your mouth
about 1.25cm.

Besides being illegal to do phone patches on 11m, 29Mhz is for the
birds - too much skip, and too many yahoos running converted ham HF
amplifiers.

"Come up to where the flavor is" on VHF.

Well, lightening took my venerable PK232 to heaven, so now, after a
period of mourning and grief, it's time to move on.

I'd like to interface my soundcard to the radio. This, along with the
appropriate software, will allow me to do rtty, pactor, psk31, etc. I
understand audio in/out for the rig/card, but what about PTT?? How do
I interface the computer to the rig for PTT control?

Thanks, all, and have a good holiday....

This, of course, could be a problem. As these were itinerant business
channels, existing users should be more prevalent in commercial areas;
mall security guards, for example. The applications I speak of will be
more prevalent in suburban areas. As far as the McDonald's ordering
usage - it looks like they will be "moving on" - they can afford a
wired connection, or Part 15 devices(more applicable to this
application).

Sure, it is only 5 measly frequencies - but it is a start!

Hi,

Welcome to the wonderful world of the sound card digital modes. With the sound card, you can do RTTY, PSK31, PSK64F, FSK31, Feld-Hell, PSK-Hell, THROB, MFSK, SSTV, HF and VHF packet!!

But unless you can find a copy of RITTY version 2.38 on the internet, you will not be able to do PACTOR with your sound card. RITTY 2.38 is one of the few programs for PACTOR and a sound card. (It really needs a TRUE Sound Blaster card. Most clones do NOT work). I do not know whether K6STI still sells licences for this version. The latest version of RITTY (Version 4) only supports RTTY.

If you still want to go on AMTOR/Pactor, it may be a good idea to resurrect your PK-232 or buy another one off EBAY. (Personally I would not recommend a KAM for PACTOR).

As for the PTT control circuit, see www.qsl.net/wm2u
It is a simple one transistor, one diode and one resistor circuit.

To interface the sound card to the radio, splice an audio isolation transformer from radio shack into each cable. The cable from your sound card output may also need a 5K resistor to reduce the level enough (the Control panel in windows won't do a good enough job). (see wm2u) Total cost $15 US tops.

Please note that most sound card programs need at least a Pentium 166 MHz computer or better.

73

I stand corrected that is could take YEARS! I just went to the FCC WTB
site, and they are going to auction these freqs off in March! I guess
the USA finally got tired of watching Europe and Japan kick our asses
in this area, and FINALLY did something. I wonder how much they had
to "pay off" the existing TV station owners?

This is still true, and I think there still are mobile laptop/PDA
character-based applications for MURS. Even 700Mhz will present range
problems - and these companies that win the auctions will need to be
putting up many, many towers... MY GOD! can you imagine the number of
cell towers out there increasing in number by 50% in the next few
years! Besides, these services aren't going to be cheap.

Good question but I have these caveats:

1) This may cause intereference to other 2400 MHz amateur operations, such as ATV or interrepeater links. Also, you might be interfering with other users of the same hardware (although interference to them isn't a concern, interference FROM them may be).

2) These devices normally operate over the ENTIRE part 15 2.4 range (2400-2485 MHz), so without playing with the frequency (as part of the modification), you'll have part of your signal out of band.

3) IF the SS method isn't the one in 47 CFR 97, are you able to figure out what hopping pattern the device is using so that you can submit it to the FCC as required? Most devices don't come with this documented.

Hi thanks for reading,

I am using Digipan 1.5, I would like to see what other's are doing for macros with digipan 1.5.

Doing this and staying within the FCC restrictions on third-party
business content is very hard.

Hi,

> It *seems* that central issue in this conflict is if the sysops should be allowed to exclude and route selectively ("censor" in the words of some) based on originating call -- arbitrarily and without giving any reason or informing the regulatory body.
>

Unfortunately it's more than that. Some focus on this point as being the main cause for the sysops' protest.

Maybe following updated information will give you a closer look on the problems concerning the draft.

73 de Thomas

Sunday Dec. 10, 2000. Today the majority of the German Packet Radio Mailboxes (BBS) have been reactivated after being temporarily disconnected from the Amateur Radio net as a measure of protest against the planned 'over regulation" by the German Regulatory Authority for Telecommunication and Post (RegTP). The SysOPs of the affected BBS systems have reactivated their services to allow users, which in the large majority have supported the protest with much sympathy, to again exchange their views and get additional information regarding the protest through this system.

Reason for this temporary cease of operation was a draft of a decree ("Amtsblattverfuegung") by the German Regulatory Authority for Telecommunications and Posts (RegTP).
This draft, among other things, includes very specific and detailed procedures for almost any operational aspect of an automated amateur radio station (ARS), including their supplementary services, like DX-Cluster. Limiting the more liberal and flexible standards of today's operation.

On Friday, Nov. 24, 2000, as a sign of protest against such overregulation, first sysops in Germany started to temporarily cease operation and disconnect down interlinks and additional supplementary services like BBS, DX-Cluster, TCP/IP-based systems and convers-servers.
In the following days the protest received widest support by a growing number of sysops. Until the end of the first protest week, more than 150 Sysops have joined the group, resulting in a virtual cut-off of vast regions in Germany from the Packet Radio Network. Only local access points
where available without routing possibilities, drastically demonstrating the effects of the new proposed operational procedures of the RegTP.
One of the fastest and closest-meshed packet radio networks of the world had ceased operation.

A week ago, interlinks, DX-Cluster and convers-servers have been brought back to life. One week later the BBS systems were re-connected to
their appropiate nodes.

The goal of this step is to enable users to get more information regarding the protest, express their opinions and views and freely exchange their mails and bulletins throughout the network.

Many users showed their sympathy for this protest action and wrote to the RegTP and other appropriate authorities in protest. The "Runder Tisch Amateurfunk (RTA)" - "round table amateur radio services" - the democratically legitimated forum of Amateur Radio Associations in Germany, does share our concern as well.

Despite all the protest, the draft of a decree is still not dismissed!
A scheduled meeting between the RegTP, the Federal Ministry of Economics and Technology (BMWi) and the RTA, has been postponed by the RegTP to next year.

The most critical point of this draft decree is the definition, that supplementary attachments to ARS like BBS computer systems, modems and network gateways are an integral part of an ARS and therefore require an expressed permission by the RegTP for operation. One of the objectives of the protest was to demonstrate that BBS and other related equipment etc. are not an integral part of an unmanned, ARS. So the ARS was available for local connections, however no interconnect was possible.

Other points of the draft which need change are planned conditions concerning technical specifications and modes of operations.
For example:

- maximum frequency modulation limited to +/- 3 kHz deviation from the center frequency!
- restrictions of German radio amateurs holding a CEPT-Licence Class 2 or less when using OSCARs.
  AMSAT-DL has joined the protest and is thinking about returning the German registration of AO-40 and enrol the satellite somewhere else.

The SysOps agree that the RegTP has to regulate our common resource, the limited amount of freqencies. It has to ensure that every radio amateur has free access to the frequencies used by ARS.

We, the SysOps of the German packet radio system, envision and request a network which is liberal and pluralistic and open for new ideas and technologies and a network which can be formed and shaped according the changing needs of their users. If politics demotes sysops to pure 'service providers', then this would be against the idea of a technical-experimental Amateur Radio Service and against a continuing future of one of the fastest and most densely meshed networks in the world.

We thank you for your understanding and hope that the interruption of PR-networks and BBS message forwarding did not cause too much trouble in your region. We are grateful for many positive responses received from radio amateurs abroad and also will take into consideration the few critical opinions received.

73
Tom DL3SBB and Uli DK2GO,
speaking for more than 150 participating SysOps

Its realy not hard to comply with FCC rules on the packet gateway.
You can always set permissiond for quests and anonymous logins
as well as ampr.org stuff and ax25. You can turn off rf ports from
internet side and allow from rf ports to internet no big deal.

I use tnos bbs and linux OS works well. http://www.lantz.com for
more info on tnos. There is also a list of tnos www bbs gateways there
to try out so you can get a feel for it. Enjoy....

Hi,

I understand that in order to receive 200 Hz RTTY etc you can adjust the
Variable shift knob on the front panel of the CP-1.

Is there a knob inside the CP-1 that can be adjusted to change the shift of
the AFSK tones generated by the CP-1?

I would like to change the AFSK tones generated by the AEA CP-1 Computer
Patch for transmission from 170 Hz shift to 200 Hz shift.

73's
Rob

No experience with the CP1, but 170 Hz shift is the standard for RTTY.
Most terminals have filters wide enough that they can copy either 170
Hz or 200 Hz shifts.

It depends on whether you're building a device driver or an
application. There's a pretty good argument that an application
should be used whenever possible, since it decreases the chance
of accidentally crashing the system in driver.

I'm another ham with an non-x86 machine around (an UltraSPARC 1).

Keep in mind, using hard-coded I/O port addresses is even sometimes an issue with a well-known hardware platform like the x86, since you're limited to devices which match the 'basic' configuration.

Suppose someone plugs in a USB->Serial adaptor and has a Linux driver for it; the hard-coded I/O addresses would not even come close to working, but IOCTLs would provide support for the new hardware for free. This is just one example, of course.

So, while platform portability may not be a critical requirement in the real world (which is dominated by x86), platform-independent techniques often bring additional advantages.

Actually I do have an RS/6000 running AIX 4.3.3 (42T model),
but wouldn't consider it for a repeater controller, as there are
tons of Intel PC boards for free.

I picked up a 486/66 32 Meg Ram, and added a CompactFlash simulated hard drive. Actually I'm going to replace that with a 200 MHz K6 board that has all the ports on the mother board, as the I/O board I have with the 486 is a little flaky, and it wouldn't be able to do vocoder algorithms fast enough. Just wish the K6 board had a sound card built-in as well, but hey, I have 2 of those laying around.

While I thought the Intel specific port commands to be adequate, and possibly some use of the parallel port as well, I've since decided that the serial port signal lines are numerous enough to do what I need. I really only need three lines: PTT, COR, and possibly a "keep alive" interrupt. I will use the termio routines.

The first goal of a PTT on COR with a 9 minute ID has been easily achieved, now comes the hard part...

Sure, that's reasonable.

If the repeater is in a remote site, or is even the least bit of hassle to access, I'd personally avoid plug-in cards as much as possible, particularly if the repeater site is subject to large temperature swings. However, this probably isn't that big of a deal.

There are some really spiffy single-board computers, like the Advantech PCM-5864, that integrate everything including audio and a scad of serial ports, but things like this cost real money (http://www.advantech.com/ in case you're curious).

Sounds like a fun project, in any case.

For the parallel port, you might consider writing a small driver which provides access to the raw bits, this way you can make custom use of it and still retain the benefit of having most of your application in user space.

I heard a rumour that there are TWO versions of Digipan 1.5.

The first version had a bug that changed your PC clock to 24 hours.  The
second version which was posted to the web site later fixed the bug.  (Why
it was not called version 1.6 is beyond me).

I suggest you download the program again and reinstall. It is not a big
download.

If it solved your problem, please post a message to this thread.

Rob

Thanks for the reply.

True, 170 Hz is the standard for RTTY. But I want to use the CP-1 on AMTOR
and PACTOR. 200 Hz is more common on these modes.

I also understand that if you transmit with a 170 Hz shift and the other
station is receiving with 200 Hz shift demod, there is about a 3db penalty.

I need an inexpensive source for a simple radio remote control system.  We
need a keychain-type transmitter and a receiver with a single latched relay
output (Push on, push off).  50-100 foot range should be adequate.

Any suggestions?

There is such a program! See GCMWIN at http://hem.passagen.se/sm3gsj/gcm.htm

GCMWIN is FREEWARE. You can add anything to great circle maps like prefixes etc.

Also see YPLOG which has exactly this feature!

But I believe that you need to register YPLOG to obtain this feature.

see http://www.nucleus.com/~field/
and in particular http://www.nucleus.com/~field/Azimuth.html

Or www.qsl.net/ve6yp

I made a mistake. YPLOG does not have an AZMUTH map. But VE6YP does have a GREAT FREEWARE AZMUTH map program for Windows.

See http://www.nucleus.com/~field/
Or www.qsl.net/ve6yp

In particular see http://www.nucleus.com/~field/azmuth/

Like most programs it is a big download. Another GREAT FREEWARE program

I've gotten several interesting replies by e-mail on this thread. Here's an interesting link:

http://www.gbonline.com/~multiplx/wireless/

I few years ago AC Nielson (the TV ratings folks) (un)-wired up my town using MMDS/IFTS equipment.   The Playboy channel was distributed this way too. These are roughly 2.4 Ghz, and there were lots of reflector/dipole antennas around with LNB like electronics. Presumably many cities have surplus from "Wireless Cable" which MMDS/IFTS was called.

One question was whether 802.11b is covered under Part 15 or under ISM rules (Part 18).

Robert Kelly, AC7KE, wrote:

But we couldn't operate that gear on a ham band because the FCC has authorized only one spreading sequence (that generated by a 7bit MLLFSR) which differs from that used by IEE802.11b gear.

--
I've got a lot more questions than answers at the moment, but it seems to me that we could take this equipment, modify it for the ham band, amplify it, and put it on a well placed antenna and get a line of sight path of up to 20 miles or so.

Anyone interested?

Was that system abandoned? These days I often read about "Drake 2880" converters that apparently were on the surplus market a couple of years ago and "are now all gone".   These were also for "MMDS".

Did the company go out of business? Or was it not so successful after all?

Rob

Do FRS (Family Radio Service) radios like those at Circuit
City have DTMF?  If so just use a couple of radios and a
DTMF decoder.  Might have to buy the DTMF kit separately.

AC Nielson had a setup called "Marketmakers" and it was activated here and in one other town. They installed special boxes that were hooked to the phone line and cable TV. They kept a record of everything that was watched and reported it nightly.

The MMDS receiver had a rooftop antenna pointed at a centralized transmitter. This was used so they could insert test commercials periodically. The test commercials were inserted only to cover a specific product.   e.g CBS delivered a P&G Charmin commercial, and the locals would see a different P&G Charmin commercial.

People in the "Marketmakers" program displayed a special ID card when they shopped at local markets and what they bought was monitored. I'd say there were several thousand ramdomly selected households in this community of 120,000 people.   I was one of them.

After about two or three years they quit, and folded that operation.

I forget the other city where they did this, but we were supposed to be "bellweather" communities that mirrored the demographics of the country as a whole.

Of course, AC Neilson is still around, but they don't do this stuff

I don't know if the company is out of business, but there was an article in QST
a couple of years back about using the Drake 2880 as a 12cm->2m downconverter.
My 2.4 [voice] repeater input uses one of these. The article was oriented
towards downlinking amateur satellite stuff.

These are pretty wide-banded in that 2.4-2.686 is downshifted. For the stock
unit, subtract 2278 MHz to get the downconverted frequency from the original.

Supposedly in one test over ocean water using commercially available gain antennas but no amps, the lucent (orinoco) cards tested to 57 miles.

It seems fairly common for people to reach several miles using fairly reasonable antennas (e.g. seattlewireless.net) and no amps.

Has anyone figured out how the VC-H1+THD7 digital SSTV modes work? That is the super-duper Kenwood only ones. I have an extra 9600 baud receiver kicking around -- and I thought it might be fun to try to maybe use this as a SSTV receiver. Does anyone know anything about these modes at all?

Though maybe I'll just set the MFJ to FM mode and then set it up to show normal SSTV on my website. This seems doable with maybe a couple evenings of farting around with software. I thought that APRS guy was proposing something like this. Did anyone ever agree on a good frequency to use for SSTV on 2m?

Ok, then I understand how a number of converters could end up as surplus.

>Of course, AC Neilson is still around, but they don't do this stuff

Yesterday I heard that a Dutch company is about to buy them. They first have to sell off other stuff to be able to afford it, though...

I have seen that information about those converters but what I found
interesting is that they appeared as surplus. It looked like
state-of-the-art stuff so I wondered if the technology was abandoned.
